In any case, the present Board cannot commit that future Board (which
may, for all we know, be a completely different group of members) to a
particular policy. There is no policy the present Board could adopt
which that future Board could not reverse, just as the present Board has
just reversed the policy (WRT the treaty) of past Boards.

I think the people who want high taxes should pay them and the people
who don't want high taxes should pay less. In other words, tax the
liberals at a higher rate than the conservatives. Then count the
number of liberals. :-)

>for more trouble than he really wants.

Haven't looked at a TS2000 yet, but I bet an amplifier is still an amplifier,
a power supply is still a power supply, and components still smoke or blow
fuses when they fail.

I spent the $35.00 for a "Service Manual" for my Icom 775DSP, and have saved
myself 3 shop calls with simple troubleshooting similar to what I did way
back when on my Hallicrafters SX-101. Voltages are lower, and components are
smaller, but the electronic theories haven't changed much.

Wouldn't go mucking about in the DSP logic, etc., but the old "7-Step"
troubleshooting protocols still work just fine on the rest of it.

My "instrumentation" consists of only a Fluke 76 DVM, a Techtronix 5MHz dual
trace scope, and and old HP-300C signal generator.

And I think I'm a pretty "ordinary" ham. Lotsa guys are much better!

It's true - so far I haven't done anything to send up the red flags.
Knock on wood.

But personally, I'm glad they vigorously collect the government
revenue. I for one, am reasonably reluctant to give up so much of my
money to them. I imagine there are others who are even more reluctant
to do so. If tax money was gathered in a donation-like process, I'm
quite sure we'd always run the government in deficit.

> I have not read much in the press about the failure of emergency devices in
> emergencies. Do we need a media coverup to make this all plausible?

Well... My take on the press, is that they don't even know that the water is cold until they run into an iceburg, and even then they get the color wrong. But that's another story.

The problem with gadgets and emergencies, is that you need a real emergency in order to test their efficiency. I have been involved both professionaly (LMR) and in RACES (off and on depending on political currents) since the Civil Defense days, and currently support US Army MARS. The simple gadgets that are highly adaptable, like an 8' Crecent wrench, are the most useful when compared to highly technical gadgets like uP controlled radios and data terminals. Multi-channel radios and programmable radios often present a problem for people who only bring them out of the back room twice a year. Even Fire/Police/Rescue people may find it difficult to talk to one another even if they have a common frequency because they might not be able to find it in their 100 channel radios.

I'm not talking about things that are broken or worthless from the start (there are those) Rather I'm talking about things that don't get used in real emergencies either because they are not adaptable to the emergency at hand, or because the available personnel isn't familiar or the equipment isn't intuitive enough.

Ham radio operators are supposed to bridge the communications gap in emergencies for those who are trained in other areas, by being resourceful with both operating and technical skills. One of the most common failures I have seen is when the equipment or propagation aren't up to the task, or the operator is unprepared to handle signed written traffic. We are valuable because we can make use of what survives the disaster, not by how well we can raid ham store shelves.

You're seeing black helicopters again, Dick. The next board may be made
up of completely different people. Do you think a completely different
board will carry on your anti-code-test conspiracy alleged above?

If you believe your opinion to be the majority opinion, it shouldn't
take too much work to load the next board with pro-code-test people.
OTOH, I suspect you realize that your opinion is held by a very small
minority of hams and is doomed to be buried in the sands of time.

We're discussing a rebellion against the US government, not the one that started the US government. Maybe I'm wrong, but one seems at odds with the other. Or are we just talking rebellion for rebellion's sake here.

I've often thought exactly the same thing. An excellent idea - and very fair. The only problem is that the liberals don't think THEY should pay more taxes - it's only the OTHER guy who should pay more taxes.

Hmmmmm..... yes, 14.7% per-annum certainly would be outrageous -- more like
$58.85 (not $39.00). 'Cording to my TI the actual increase was almost
precisely 3.5% per-annum, except they skipped some annums, so we actually
saved $7-and-change in the interim.

Percentage increase = 100*(increase/present-cost)

If the increase is $5 and the present-cost is $34, then that's a 14.7%
increase from one year's subscription to the next year's subscription.

I was disappointed that the BoD display this "go with the flow -
wait and see" attitude. Having sat in that room in the past,
I know that boldness is often punished, but this seemed like
the perfect time to display some leadership and vision.

Opportunity lost. Sigh!

Yep. But that wasn't the topic being addressed, which was a comparison
of the dues increase to the rate of inflation. To compute that you need
to include the term over which the increase occurred, which is 4 years.
Your calculation ignores the lack of increase between 1997 and 2001 and
thus fails to address the question.

Figures don't lie, but...

I am not as concerned with the content, as getting the air time. I live south of Atlanta and have never seen a PSA on ham radio on any of the channels I watch. I am a night owl by nature, and some of the PSA's used to fill time in the wee hours are covering some really inane subjects.

This week, just for grins, I will make some inquires to the stations in Atlanta and Columbus to see what is necessary to get them run.

A membership cost increase is a step function like a binary bit going
from 'zero' to 'one'. It didn't happen over a number of years. It's
a step function that happens at renewal time.

Is there any difference in having one double-scotch per day for a week
VS not drinking for six days and then having seven double-scotches?
"But ossifer, I only averaged one double-scotch per day."

But the inflation it was being compared to is an average over time, so to make any meaningful comparison you have to compute a time-average for the dues increase over the same period as used for the inflation computation.

Really? Since you seem to know all about this, what happened to the US Constitutional government that made a restoration necessary in the first place? These ground rules were never actually established. Larry just said that it would be okay for 10,000 people with guns to attack the nations Capitol (he then added that that wouldn't be the case if they were people who he didn't happen to agree with).

I don't see any reason to not start kicking the donkey in the behind now.
That way when it gets good and ready to move it will be right on our
"schedule", not its. No time like the present to get people use to the idea
the code test is going down the drain. Wait a few years until the ITU treaty
requirement is gone, then START fighting to get the ARRL, and the FCC to
consider dropping the Code test requirement for another few years? No way.

That is exactly the approach that works best. Local stations respond more
to local viewers than they do to a request from a national organization.
Jen Hagy should be able to help, if needed.

I think that is less likely than my theory that the Board decided not to solve a problem that would not surface for at least 4 years. I think it very unlikely that the ARRL will originate petition for rulemaking that will certainly follow any change in the international treaty, but at this stage, it is not certain what the final treaty will look like or just what rules changes will be put on the table. I agree with the Board if they decided not to cross the bridge until they could see just what kind of bridge it is.

Your tightrope theory just sounds less plausible to me.

If you meant the opportunity to change ARRL's policy 4 years before that policy change could have any effect on US regulations, I guess technically it is a "lost" opportunity, but this is an issue that the ARRL Board will have to address again when the inevitable FCC NPRM comes down the pike. I think anything the Board did now would be pretty much moot and may have to be re-done in response to the actual content of the NPRM,or even of the treaty itself.

As you have sat in that room, you know how difficult it can be to hammer out an understanding with 15 different viewpoints on the table at the same time. If deciding to change only the policy wrt the international treaty at this was the only way they could get enough agreement to get ANY resolution to pass, I can understand and accept it.

This is not true. You are misrepresenting what I wrote, Cecil. That's beyond the pale. I am posting this to both NGs so there's no confusion.

> I say there is at least one and probably more.

Nobody denies that. I simply refuse to play your game.

Yet you continued to post to the "no-code kills" thread long after you promised to stop. At least 40 posts on that thread, involving all sorts of things like your experiences in aircraft in South America, were posted to rraa. Many were posted ONLY to rraa. Only about a third of them involved me in any way.

> Jim, N2EY, is redirecting everything back to r.r.a.antenna where it
> doesn't belong. That's the reason for the disconnect.

You keep redirecting it because you know I don't post to policy anymore. I made this exception to avoid any more of that.

> Jim will not
> admit that there ever has been a single code-tested ham using Morse
> equipment for the purpose of jamming.

That is simply not true. I just won't play your games. So you are distorting and making stuff up about me behind my back.

> He refuses to condemn code-
> tested hams who use Morse equipment for the purpose of jamming since

> he says there never has been any.

Wrong, wrong, wrong, Cecil. I have repeatedly condemned ALL jammers on the ham bands, regardless of testing or mode. The ones you mention are a subset, and so are logically included.

> That's because any admission of
> such would violate the immaculate conception virginal religious
> aspect of Morse code to the PCTA.

Nonsense. I just won't play your games anymore.

Much of what you have written about me is simply not true, Cecil. I have pointed out your mistakes above. You will not admit them, of course.

Anyone who believes what Cecil has written can check deja.com and read my posts for themselves.

Enough of your games, Cecil. I'm sorry you are so bored that you have to spend time trying to "get other people's goats".

Game over.

Hello, Leland,

I don't think the FCC is going to entertain any petition for rulemaking wrt code testing until the treaty is changed and ratified.

It is very much appropriate to start working on the ARRL Board now, by sharing your views and either convincing your ARRL Director why they should hold sway or by voting the guy out and voting a new guy in. What is your Director's views on the US requirements? You may find that your job is already done. :-) Of course, others may be trying to persuade him in the other direction. Tom Frenaye already knows my views, but I took the time to reiterate them before the Board meeting.

I agree with that too; a better selling job needs to be done. In my case, it has never been a question of belief, but of finding the time to spend 2-3 days working on an informative article before the next emergency seems to come down the pike.

I will promise to my friends here that once I get a bit more staff in the Lab to handle some of the individual RFI issues, I will put together a lot more info on what I have been up to and I will see that it gets published somewhere.

When I was a Nervous, those articles on the basics were really neat and exciting; they were high-tech to me. Now that I am a seasoned old vet, the same articles are "really dumbed down" in QST.

Go back and look at those old articles with today's eyes.

I think, Jon and Dick, that the term "per annum" may have been misunderstood. If applied to a 4-year term, a per-annum rate is applied each year. After all, if one puts money in a savings account at a per-annum rate, they certainly would understand the term if the bank only applied the interest to one year. :-)

So, lets take it step by step, over 4 years.

Year 1: $34.00 + (.035 * $34.00) = $35.19
Year 2: $35.19 + (.035 * $35.19) = $36.42
Year 3 : $36.42 + (.035 * $36.42) = $37.69
Year 4: $37.69 + (.035 * $37.69) = $39.00

This worked out to 3.5% increase each year,except that no one had to pay the $35.19, the $36.42 or the $37.69; it stayed at $34.00 for those years.

Does that help?

And the increase is not retroactive. :-)

And, if you really want to beat the system, do what I just did; renew for 3 years on the ARRL web site at the $34.00 rate. That way, the increase won't be proactive for 3 years, either. :-)

It is no suprise that the FCC ignored the ARRL, since they
were initially demanding that the FCC continue a regulation
(13 & 20 wpm code test) that was not in conformity law
(5 USC 706).

FCC gave the ARRL plenty of opportunity to show some
leadership, but the Board said "no change". So FCC
proceeded without them and issued the License
Restructuring Decision. The ARRL ask the FCC to use
5 & 10 wpm code exams. The FCC's Report and Order said
that Morse code exam requirement served "no regulatory
purpose". So what does the ARRL Board do? They
demand the FCC continue 5 wpm code exams.

I personally advocate thpetition the United States/FCC to adopt a WRC 2003
policy to: (1) suppress ITU rule S25.5, (2) take exception to S25.5 in the
WRC 2003 Final Acts if it is nor suppressed, and (3) delete 47 CFR 97.503(a)
after the conclusion of WRC 2003 without any futher proceedings.

The so called "bridge" you claim the Board can not see is in fact a great
wall that surround Newington, casting a shadow over Board's vision.

The Board spent thirty years constructing that wall, now it scheduled
for removal in 2003.

Since the Morse code exam requirement is a public policy matter,
and the amateur radio community is about evenly divided, the ARRL Board
could have elected to take no position, and not interfere. For thirty years
the Board has act contrary to the public interest and contrary to the
interest of the majority of licensees.

I can not understand nor do I accept it.

The ARRL's comments to the FCC were plenty of change, Larry. Trying to rewrite history here?

> The ARRL ask the FCC to use 5 & 10 wpm code exams.

It was 5 and 12 wpm, if accuracy is important.

> The FCC's Report and Order said that Morse code exam requirement served

> purpose". So what does the ARRL Board do? They demand the FCC continue 5
wpm code exams.

When? In its comments to the FCC for restructuring? NCI agreed that a 5 wpm test was needed to satisfy the treaty? Now? Can you tell me where and when the ARRL communicated their "demand" to the FCC? The language of the ARRL policy was clear enough to me that the League is choosing not to change its policy wrt US testing at this time.

You are misrepresenting facts, Larry. It does not reflect well on you or your goals.

In taking a long, hard look at what the ARRL offers and does,
I would say a $45 to $50 annual membership is reasonable for
the membership advantages.

That is outside of the "QST subscription." QST should be able
to self-support based on advertising sales for a "captive"
170 K or so readership per month.

All the other services should be worth the increased price of
membership IMHO.

In my case and that of many others, the issue is less about
cost than of what the BoD decides is good for the member-
ship...or for the US amateur radio community as a whole,
in particular the license testing regulations.

Is it?

>It will be at least 4 years away before the FCC
>would even consider a change, looking at the timing of the WRC and
>estimating the amount of time it will take to ratify the treaty.

The US Congress mandated the FCC to perform biennial reviews
of regulations. "Biennial" is defined as every two years, not four.

I thought ITU-R standards are voted and adopted, not "ratified."
The "treaty" is a statement that the USA is a member of the
ITU and supports it, not the individual standards for any particular
radio service.

>I think
>that it is premature to set a policy now on a matter that cannot be changed
>now and that can be decided better when something specific can be put on the
>plate.

I thought that any sort of "policy" affects the future. The decision
could have just as easily been made to read that it (the BoD)
supports that the FCC should begin changing the code test
requirement as soon as S25.5 is deleted or amended to void the
code test for a below-30-MHz-privilege amateur radio license.

>A lot can change in the membership, in Amateur Radio and in the
>makeup of the Board in the intervening 4 years.

Yes, a meteor can fall or aliens invade the earth...

>It is, IMHO, up to a
>future Board to change or affirm its policy wrt US regulations when it

>appears that it is time to act. The present policy simply does not change
>the status quo wrt the ARRL policy on US requirements. Considering that no
>change in policy can effect any change in US regulations, I think the Board
>made a reasonable choice.

I see the BoD as thinking more of its and the ARRL's future
insofar as membership numbers. Hard-line PCTAs are
more likely found in ARRL membership than outside. That's
as it should be since the ARRL need only be concerned
about its membership.

>The Board dealt with the international treaty now because now is when the
>decisions need to be made.

Disagree. The time to act, to show the leadership and vision
stated by Hans Brakob, should have come at least two years
earlier. Stating that time-now was "the time to act" looks
more like a rubber-stamp approval of whatever the BoD does.

The issue of eliminating the code test requirement in S25.5
surfaced in earnest about four years ago, did not happen
overnight. As far back as 1990 the FCC said (in the R&O
establishing the Technician class license) that a code test
does not fit with their requirements as to licensing. The
time to act was before this weekend.

Stubborness (perhaps lethargy) in seeing the future laid
out before them is not an endearing quality of the ARRL
leadership. Such may comfort the membership but does
nothing to bring in new memberships (and dues monies)
from the over 3/4s of all US licensees that are not now
members of the ARRL.

>IMHO, of course.

Of course...and IMHO too.

>Opportunity lost. Sigh!

While I did not expect boldness and vision in leadership, I am heartened that the BoD went as far as it did. Given the past emphasis on morse code abilities thought necessary for all radio amateurs, the BoD decision seemed to be a Major Upheaval in Attitude! I have to give the BoD a warm round of applause in appreciation of actually getting around to changing its collective mind!

It will now be interesting to see what happens with revised Agendas for WRC-2003 after the International Bureau's meeting of 30 January 2001 on Agenda item details. :-)

Note: The present agenda for WRC-2003 carries a non-specific statement concerning "S25" (not S25.5 but only of all standards inclusive in regard to amateur radio). If the ARRL has any clout left with the FCC, the new agenda may show something less general than it does now.

>Very few hams have a spectrum analyzer.

On one hand, a TxPorter from Motron is considered "valuable" at $800 for fingerprinting repeater kerchunkers, but a spectrum analyzer is not considered good?

An MF to VHF amateur spectrum analyzer can be built for less than $400 in essential parts, using an old oscilloscope for a display. Analog Devices has some excellent logarithmic amplifier-successive-detector ICs that can yield an 80 db dynamic range. Mini-Circuits has a line of good VCOs (Voltage Controlled Oscillators) that can serve as the first L.O. swept by a 555 timer generating a sawtooth waveform. Up-convert the first mixer output, filter it with a high-Q resonator, then down-convert to a choice of narrow filters. The Agilent (new name for HP Test and Measurement Div.) website has some excellent free download tutorials which explain the principles. Other than the essential items mentioned, the ARRL Handbook should have all the details on supporting circuitry.

A spectrum analyzer is an excellent instrument for displaying the harmonic content of a transmitter, for "sniffing" out RF leakage, and can show the quality of modulation of SSB, AM, FM, or PM...even OOK CW with slow sweep speeds and sharp IF filtering.

Such an instrument could be designed and built as a club project, made available for club members' use. It doesn't have to be an integral part of any individual radio amateur's equipment. It is a good receiving tool if used as an indicator of received signals a la the old "Panadapter." Icom has made receivers with an auxilliary 1st IF output specifically for an external spectrum analyzer connection.

Very few hams have fingerprinting equipment, too.

I think the spectrum analyzer would be the more valuable of the two.

You are correct; it is relatively easy to build and use a spectrum analyzer,
although the inexpensive ones often do not have a lot of dynamic range.

Two good sources of info are:

http://www.arrl.org/tis/info/pdf/9808035.pdf - Part 1- a spectrum analyzer
construction project
http://www.arrl.org/tis/info/pdf/9809037.pdf - Part 2
http://www.science-workshop.com/Joe_Carr%27s_NV_article.htm - Poor man's
spectrum analyzer

A tutorial on spectrum analyzers is found at:

http://www.science-workshop.com/

Not at all, but it will take me 2-3 days to put together the info just on VDSL, Home Networking and a few of the other immediate threats. ARRL should put together more stuff like:

http://www.arrl.org/tis/info/rfiteljx.html

> Dump the lab, turn it over to somebody else and get outta there. Your RFI
> activities while being of a technical nature are much more political, consensus
> building and educational pursuits which have nothing to do with lab tests of the
> latest whizzy xcvrs.

You are quite correct; RFI and equipment testing are two different beasts. Mike Tracy does our equipment testing. Problem has been, up until this past weekend, that I have been doing individual member contact on RFI problems, working with utilities, manufacturers and the like on individual RFI problems, contact with industry groups (VDSL, HomePlug, Home Phone Networking Alliance, to name the recent ones), assigned tasks to help prepare our comments to the FCC on various regulatory issues, participation on 4 different industry standards committees, plus a few ARRL Board-level committees as staff liaison or as a member. And, of course, the occasional 2-3 day writing assignment for articles and the day-to-day supervision of the guy who does the testing, the guy who puts up the TIS pages and, of course, Zack, our Lab "generalist." You are correct; all of this cannot be done justice by one person; some of those areas are seeing a growing backlog. I am not saying this to brag, but in support of your view that a full-time effort toward just the RFI component is needed.

> Considering your background and the ogre content of the exponential escalation of the number
> of Part 15 devices (among other threats) SOMEBODY gotta put full time into it.

Yes, indeed; I expect to see the Help Wanted ad for the several new HQ positions that will be created as a result of the last Board meeting hit QST for the March issue, and it the ARRL Web page, probably tomorrow. Check http://www.arrl.org/announce/jobs/ over the coming couple of days to see the general scope of the position. I may continue to do some of the industry

committee liaison work because it is going well, but I definately want to see a full-time effort go into addressing the growing problem of RFI to hams. That will also let me work some on some of the R&D and noise studies that I have been hoping to find some time to do, and to occasionally work a 40 hour week. :-)

As you point out, Len, the ARRL Board does not (and IMHO should not) decide the US licensing regulations. The FCC has sole regulatory authority over the Amateur Radio Service. The ARRL Board determines only ARRL policy. And among the things the Board has decided is good for the Amateur Community are the very things you say should be worth $50 a year. Actually, considering that they are funded by a combination of dues, advertising revenues and pub sales, plus a smattering of donations, they probably are worth just about what you cite. :-)

Not me. I gathered that Larry was referring to the possibility that somehow the government had become so tyranical, in violation of the Constitition, that someone concluded that armed rebellion was again in order. I can't imagine that, but I suppose it can't be completely ruled out.
Sometimes you wonder how far some of them can incrementalize things without going over the line.

take
> no position and not interfere...

Ed, NCI only represents person who support an end to Morse code exam requirement; whereas the ARRL represent a much large number of licensees that are about evenly divided on the matter. When the ARRL Board takes a position on this matter, irregardless of the position, it going against the interest of about half of its members. The ARRL Board would have acted more responsible by presenting both side of the matter, and telling members to file their own comments with the FCC. In stead it chose side against a large number of its members and further dividing the community.

It was ARRL that was a major influence in getting S25.5 adopted by ITU and in convincing the FCC that the amateur radio community wanted continued Morse code examinations.

The ARRL Board should have told the procoder to go argue their own case, and not waste member funds on a matter that was not in conformity with law.

> frequency vs meters or to use 300/F?

I think a smart test taker will use the easiest method for each part of the test. Memorizing formulas and working out the answers is probably the easiest. And memorizing the questions and answers for complex technical questions is probably the easiest...

Professional ham engineers excepted... :-)

Using the total US population for comparison might make us look better technically as a group simply because of the large growth of ham radio compared to the total population. There probably would be more of everything, from technical hams to liddy hams. But if you wanted to compare the average amount of technical hams in 1960 to the average amount of technical hams in 2000, it would have to be referenced as a percentage of total hams (for each time period) to reach any kind of valid comparison. I don't know how you would ever do that (for many reasons), but I have a definite opinion on what the answer would be... :-)

Perhaps the rate increase does seem large. However in comparison to my hospitalization insurance which went up $200 a *month* or my property taxes which went up $2000 a year (my fault for moving to a nicer place), a $5 increase just didn't strike me as being all that bad... :-)

Try plainspokenly. Why can't you folks at Newington just state the
facts in plain language?

misinterpret simple,
> direct statements and then use their misinterpretation as "evidence" of
> unethical behavior on the part of the other party.

So you assert that you folks at Newington never "spin" things to make
them appear just a little better than they actually are? You say that
the increase is only 3 percent per annum, gee, that isn't much. But the
simple fact is that it amounts to a 14.7 percent increase each and every
year, henceforth. If you had said it in plain terms your statement would
have made note of that.
Intended or not-and I fully accept that it was not-, your statement was
ambiguous to anyone not current on accounting terms.

That is what I felt the meaning of "at this time" means.

> The US Congress mandated the FCC to perform biennial reviews
> of regulations. "Biennial" is defined as every two years, not four.

I will gladly put a lobster dinner wager on whether the FCC revisits the Morse code testing as part of its next biennial review. I would go for dessert that they don't even make major changes the next time around.

> I thought ITU-R standards are voted and adopted, not "ratified."

I may be wrong, and will defer to those who know, but after the ITU adopts the standard, does it require ratification by Congress in any form? Larry? Phil?

> I thought that any sort of "policy" affects the future. The decision
> could have just as easily been made to read that it (the BoD)

It could have been made. I don't think that it could have been made "easily" considering the strong differences of opinion amongst ARRL members.

> >A lot can change in the membership, in Amateur Radio and in the
> >makeup of the Board in the intervening 4 years.

> Yes, a meteor can fall or aliens invade the earth...

My views have gone through some evolution over the past 4 years. Every single Director who serves on the Board now will be facing an election cycle over the next 3 years.

And as to the meteor, as compared to 1997, ARRL has a new President; two of the three Vice Presidents are new; the International Affairs Vice President is new and 9 of the 15 Director slots are filled by different people than

held the job in January 1997.

> I see the BoD as thinking more of its and the ARRL's future
> insofar as membership numbers. Hard-line PCTAs are

Do you believe that ARRL's concerns about the overall health and well being of the Amateur Radio Service are not int the best interests of its membership? I also think that the overall health and well being of the Amateur Radio Service are what is good for the ARRL.

I agree; in my personal opinion, two years ago would have been better. Would the Board have reached the same decision two years ago? Did it?

Precisely the problem. If you don't make it clear what your point is- and the use of "3 percent per annum" with no further clarification won't work much of the time- and when it is clear that it's gonna cost 14.7% additional each year to subscribe, well, I think you can see the problem. Not everyone thinks in accountingese. I'd venture that most people don't.

Did you not know that the last dues increase was in 1997?

Was the information that the standard dues rate was going from $34 to $39 somehow mislead you. Was its point not clear?

The term 3% per annum means 3% per year. A statement that the dues rate did not exceed the inflation rate because is has increased at 3% per year since the last dues increase in 1997 is not "accontingese," Dick; those concepts were taught to me in junior high school.

When the restructuring occured, ARRL presented its reasons for its decisions to its membership, then encouraged members to file their own comments with the FCC.

I provided a good example for the formula-based questions; can you supply a good example for the complex technical questions that are best memorized without understanding?

I do agree that a few questions fall into that category. When I answered the question about parasitic oscillations in 1964, I didn't have a clue what one was. Amateur Radio surviced and I think that giving me a ticket worked out okay for the Amateur Radio Service. In my own small way, I have made contributions.

I think that we are approaching the same idea from two different directions.
(Imagine that!) Most of the "high-tech" folks will enter ham radio whether
we have a test that is very easy or one that really taxes them. The number
of highly technical hams is not apt to change.

idea of amateur-licensed celebrities being involved in the process --
donating their time, talent, and industry influence to assist with
production?

>What percentage of people that might be interested in ham radio do you feel
>do not know about its existence?

At least 80% of the general population probably don't have a clear
idea of what the thing called "ham radio" is about. The rest, if they
understand the basic concept at all, are probably more likely to
confuse us with CB than they are to have an accurate picture in
their minds of ham radio and what hams do.

Ed:

There is no need to concern yourself about me. I am no longer involved
in amateur radio instruction. The licensing requirements are so
dumbed-down now that I don't want to be publicly associated with the
concept that prospective hams may actually need assistance in
meeting them. That, IMHO, would be an insult to the intelligence of
the general public.

>Ed Hare, W1RFI

Ed:

Well, I disagree on this one, partly due to personal experience. I've
always been one of those "Math-challenged" people -- my father is
the same way. I had to take a "Math for Dummies" course at the
local community college in order to fulfill the requirement for my
Bachelor's degree. It was a self-paced course, and it took me
two semesters to complete it with a grade of "B" -- the highest
Math grade I ever received in my life. Ham radio, even the "old timey"
written tests I took in the pre-VE days, did nothing to inspire me
to learn advanced mathematics to the point where I can exploit
that knowledge on a daily basis today. For this, and a lot of other
reasons, I don't think ham radio can be the educational salvation
of an already illiterate person. If it wasn't enough of a motivator to
make me a Math-capable person, I don't have faith in it being a
motivator to make a person able to read and write, either.
Moreover, my personal preference would be to steer the
illiterate AWAY from ham radio, in order to demonstrate that
gaining literacy skills MUST take priority over hobbyist activities.
My reasoning is that a person who learns to read only to pass
their ham radio tests may throw that skill away once they barely
succeed -- much the same way Morse code skill is discarded
once HF operating privileges have been attained. The fact that
a ham radio ticket is an "end game" to the learning process for
many "hams" means that to me, it doesn't seem like the
powerful educational tool some hams claim it to be.

Yeah, the League should have just come out and said that the dues went up by $5 and not tried to hide it. Maybe we can get them to rewrite the news story to just say that they went from $34 to $39 a year.

Dick, Jon's initial statement was made in response to Dave's claiming that the dues increase had exceeded the rate of inflation. In that context, what he said was perfectly accurate and useful. He didn't say it hoping to confuse you. You did that part on your own. :-)

No Ed, I talking about before the FCC issued its NPRM for
WT Docket #98-143. The ARRL had setup committee
to study license restructuring, the committee recommend
changes, but the Board reject all three motions.
Bad decision, had they followed committee recommendation,
the FCC probably would have adopted it, NCI would not have
been formed or been motovated to act. As you say, that all
history now and can not be rewitten.

January 20, 2001

> NCI agreed that a 5 wpm test was needed to satisfy the treaty?

No, NCI ask for no code exams, but conceded that it may not
be possible for the FCC to take that action, and reccomend in that
case that only a 5wpm test be used until S25.5 is supressed.

> Now? Can you tell me where and when
> the ARRL communicated their "demand" to the FCC?

Strike demand; insert influence, lobby, comment, recommend, etc.

> The language of the ARRL policy was clear enough
> to me that the League is choosing not to change its
> policy wrt US testing at this time.

How does that serve the public interest and
the interest of members that oppose the
Morse code exam requirement?

What purpose is served by the Board using
all members due against the say a third of the
member interest?

> You are misrepresenting facts, Larry.

Who authored the letter to the FCC? What form did it take? Why did not this action with the FCC appear in any of the writeup about the Board meeting that took place at the same time? This was not discussed at the HQ staff meeting that took place after the Board meeting, nor did any of my friends on the Board discuss it with me afterwards. Why would the ARRL ask the FCC to continue something that it is already continuing? The FCC has not proposed to change the rules. Are you sure you don't have it mixed up with something else? No matter, I am sure we will read about this secret demand -- I mean request -- on the FCC web page later in the week, if you are correct.

> > NCI agreed that a 5 wpm test was needed to satisfy the treaty?

Okay, can you tell me where and when the ARRL communicated their recommendation to the FCC?

> > The language of the ARRL policy was clear enough
> > to me that the League is choosing not to change its
> > policy wrt US testing at this time.

> How does that serve the public interest and
> the interest of members that oppose the
> Morse code exam requirement?

It was not intended to serve the interests of anyone; it is a decision not to change the present policy at this time.

> What purpose is served by the Board using
> all members due against the say a third of the
> member interest?

If those figures are correct -- that you believe that 1/3 of ARRL members support the removal of the US requirements for Morse code testing, then what purpose would be served by using all members' dues against 2/3 of the members interests?

Larry, stop seeing the Devil behind the bush. Stirring up trouble where none exists will weaken the effect of the ARRL's position wrt the international requirement, don't you think? The League simply clarified to its members that its decision not to oppose the elimination of the international treaty is not tied in with its position wrt the US testing requirements.

> > You are misrepresenting facts, Larry.

> No, Ed you just do not like the true facts.

I do indeed like true facts, Larry; I just don't think that your reading all sorts of things into the League's policy is at all useful.

> > It does not reflect well on you or your goals.

> Personal attacks do reflect well on you.

Do you believe that all who disagree with you are "attacking" you. You are mistaken on that, too.

Amateur radio will survive the Bash like test we have today too.
That's not the question though. The question is: Do you think that a
test that allows people to pass without knowing the material is a good
test...

>In my own small way, I have made contributions.

There's no doubt about that Ed. Your accomplishments are outstanding ,
and I mean that sincerely. On the other hand, I've done absolutely
nothing for the ARS except use it. But what does that have to do with
our discussion on the merits of today's ham tests... :-)

Things would have to be a lot different than anything the framers of the Constitution ever imagined. I think they were trying to obviate the necessity for such things when they created that document.

But if it ever were to come to that, it sure as heck wouldn't be Brown Bess's and swords.

If I may disagree Larry, it is difficult to decide not to read, once you learn how. It is impossible to drive down the street and not read a billboard or two.

This particular guy was never allowed to attend school because his parents were uneducated fundamentalists. He was told most of his life he was not able to go to school because he was mentally handicapped.

He originally came to the lessons at my house because his buddies did. When he was having real problems with the code, I asked him to come over by himself a few nights.

The stupid one was me! It took me three nights before I finally realized he was illiterate.
When I finally asked him if he knew how to read he was very embarrassed. I asked him if he would like to never be embarrassed again. Then we started to work on learning. I learned as much as he did. I did not know how to teach someone to read, I have that skill now.

Within a year he was reading at a 10th grade level and we went to the Knoxville Hamfest for him to take his test. He came out of the session with a ticket and you couldn't have wiped the smile off his face with a shovel. I was like a proud father and I must admit to a few tears rolling down my face in joy.

I do not know if ham radio was the motivator or the vehicle, neither do I care.

What I said was that it wasn't very different from the rate of inflation
over the same period. I didn't say it "wasn't much" of an increase. In
fact, I said that ARRL members would decide that question for
themselves. Why do you "spin" things to make them just a little worse
than they are?

> But the
> simple fact is that it amounts to a 14.7 percent increase each and every

> test...

Already answered. Now if you will admit that the question is not at all related to amateur radio testing, I may answer it differently, right after I ask you why you keep bringing it up in threads about amateur testing it if is not related. :-)

> >In my own small way, I have made contributions.

> There's no doubt about that Ed. Your accomplishments are outstanding ,
> and I mean that sincerely.

No, I did mean small contributions. Much of what I have done is to coordinate the learned work of others. Valuable, perhaps, but not brilliant.

> On the other hand, I've done absolutely nothing for the ARS except use it. But what does that have to do with
> our discussion on the merits of today's ham tests... :-)

The fact that I took a test in 1964 for which I did what I feel most people are doing today -- a combination of learning, memorizing, lucky guessing and skipping a few tough topics. I don't believe that the scope or difficulty or relative learning of todays tests are easier than they were in 1964, to the contrary; I believe that the difficulty is somewhat higher. Why would you expect me not to discuss today's tests it the context of tests I actually took?

I hate it when people do stuff and then fudge the math to say they did
something else.

If you got a pay raise for the first time in 3 years, do you divide the 10%
increase over 3 years and tell your wife you got a 3.3% raise, or the actual
10% you received. That per year stuff may work for a bean counter but it is
a 14.7% over my last dues for me.

Increases not made during previous years only enter the picture if you use
the Clintonista type math. I am a big kid, I understand that dues increase,
just don't blow smoke up my kilt and justify it with non-retroactive
increases.

Well let's see...
Jon first calls Dick ignorant (among other insults) and then calls Cecil a liar. I think everybody knew it was a 5$ increase. The difference in opinion was in how the percentage was figured. Do you think that Headquarters handled their part of the argument civilly??

Jon to Dick:
"14.7% PER ANNUM (over 4 years), Dick? Your calculator's broken. Or maybe it just needs a new battery.This is one of the reasons I don't hang around rrap much any more -- too many people like Dick who (willfully? ignorantly?) misinterpret simple, direct statements and then use their misinterpretation as "evidence" of unethical behavior on the part of the other party. Guess my stomach for idiocy like this isn't as strong as Ed's.

Jon to Cecil:
Figures don't lie, but... [liars figure]

You response left me in a dilemma Ed, I understand you felt I had done a good thing, and in your way acknowledging it was a good thing to do.

I was troubled by the "politically correct" remark. There was no politically correctness involved. It was one human being helping another, a ham mentoring someone who wanted to be come a ham.

This is the antithesis of "political correctness". Which is defined as giving lip service, to enhance ones standing with other like minded, ribbon wearing liberals, and results in little if any real change.

> >
> > Opportunity lost. Sigh!
>
> Hans! Whatcha doing, politicking for Head Honcho of NCI?

As the guy on TV sez, "Gimme a break!"

I do not support the destructive agenda of NCI.
They are a splinter group of a few dozen loud
mouths like Carl, Larry, Bryan, etc., snapping at
the heels of the Amateur Radio service, claiming
credit for some sort of 'victory' which was decided
by the power of technology 20 years or more before
they were organized.

If I had my preference, there would continue to
be a Morse test as part of the entry to Amateur
Radio.

But that war is lost.

It is time for me to use whatever energy is left
to me to advance other important issues which have
NOT yet been decided.

When I lived on Guam in the mid 60's, twenty years
after VJ Day, there were still a few Japanese soldiers

hiding in the caves and jungles of southern Guam, fiercely loyal to the Emperor of Japan, who did not know the war was over. They were proud but pathetic creatures, warriors in the service of a cause which had been defeated two decades earlier. Their weapons were rusted to uselessness, their uniforms a distant memory, and their country and the world had passed them by.

They were called "The Stragglers".

The war for Morse testing has been lost. Rather than become one of "The Stragglers" of this war, a faded warrior defending the Emperor of Morse Tests, I'm turning in my uniform and musket, and turning my energies to other Amateur Radio issues which need attention.

I don't know whether you are not being forthright or are just forgetful
in your old age. I did not seek any praise. I did not come up with the
circuit. I simply used what was already in place. As I recall, you
tried telling me that what I stated was untrue. State didn't replace
the last model 28 in Africa until 1991, Len.

I don't think I made that statement, Ed. All I said was that inflation
was low. I never used the per annum term nor keyed the dues hike to the
annual rate of inflation.

Hans, when I was active on HF back in the 60s, that was the common expression. "The handle here is ..." was the norm. Apparently, CB picked up on this and therefore everyone now says this is a CB term. Oh well. I got my knuckles rapped for this once. I don't get upset anymore. We had a guy on 440 FM ranting on about the importance of CW. We tried to change the subject, but he wouldn't let up. Fortunately, the repeater owner was on the repeater in the group so ... he and I switched to F-2 emission - about 40 WPM. That ended that. Whatever someone wants, now I try to accommodate them. This even included (many years ago) switching to American Morse on the air!

True. I'm sorry. There were indeed some positive things. In addition to what you mention, there is also a renewed awareness of semantics, which can be very helpful for those having an affair (I did not have sex with that women - I don't define "oral sex" as sex). Boy, that can be stretched to fit many sexual activities (which is what makes it so useful), but I'll leave that to the imagination of others. ;-)

I think that the industry liason work should take top priority. We gotta focus

on stopping the production of devices which generate RFI rather than "fixing"
the RFI sfter it shows up per your 3.5 Mhz modem work. That's like closing the
gate after the horse got loose. These computers are hideous RFI generators, nag
the FCC, this is ridiculous.

>Using the total US population for comparison might make us look better
>technically as a group simply because of the large growth of ham radio
>compared to the total population.

I agree. I also think it is more accurate to use the entire body of evidence
for comparison.

>But if you wanted to compare the average amount of technical
>hams in 1960 to the average amount of technical hams in 2000, it would have to
be referenced as a
>percentage of total hams (for each time period) to reach any kind of
>valid comparison.

I disagree. As you said, comparing to the whole gives a better idea about the
relative number of technical hams. Which do you think is a better goal -- to
have more technical hams, irrespective of the total number of hams, or to have
a greater percentage of technical hams, irrespective of the total number of
technical hams? If all of the non-technical hams (I don't even know how you
would define that -- perhaps you could keep asking them on usenet if a test
that doesn't test knowledge is a test) quit, the percentage of technical hams
would be 100%; would the technical value of Amateur Radio change in the
positive direction? I think not, because those "non-technical hams," are not
totally devoid of technical knowledge; this is not another black and white or
yes and no answer.

> I don't know how you would ever do that (for many
>reasons), but I have a definite opinion on what the answer would be...
>:-)

I am sure the answer would have to be "yes" or "no" or you would keep asking
the question. :-)

That is exactly what I am saying. Although I do see ways that the present tests should be improved, I think that testing that has not created major problems in 40 years of being at about the same level is not an invalid test, to use your words.

I agree, but if it is sensational, the press will cover it. They may get it wrong, but they will get it.

>The problem with gadgets and emergencies, is that you need a real
>emergency in order to test their efficiency.

I am not sure that the emergency equipment of today is all that complex. If I designed it, I would design it such that the operator pushed a button and the "SOS" was sent. I bet that such equipment is more reliable than the HW-7 that you used as an example.

>> Per-annum, Dave. You know, the same basis on which inflation is usually
>> stated.

>But that wasn't stated by me or by you, Jon.

Sure it was, Dave. You stated that the dues rate was excessive wrt inflation. Inflation has an implied "per time" factor built in to the very meaning of the word. In the context you used it, the only way to compare the dues increase to inflation is to go back to the last dues increase and compare the increase to inflation over that time. Most inflation figures are reported on a percentage vs time basis (usually annual) so the easiest way to compare them is to give the annual rate of the dues increase as a percentage. Jon did so, and added the per-annum qualifier to make it more clear.

> Without the qualifier, the one-time hike is much steeper.

If you feel that the ARRL should increase the dues every year at a rate that matches the general inflation rate instead of catching up every four years, you should suggest that to your Director. When you do, keep in mind the way the League did t this time saved you about $7.00 over the 4 years it did not increase the dues.

How much would it cost you each additional year after this if the dues had increased 3.5% every year since the last dues increase? The number are the same from this point onward whether the dues increase happened in one chunk as it did, or at a 3.5% rate every year. The way it is done, you have $7 more in your pocket; I can't see why you are displeased.

> Not everyone thinks in accountingese. I'd venture that most people don't.

Dick, this is not complex; it is junior high school math.

> I do get a lot of use out of it. Its expansion should definitely be >
encouraged.

I agree, although we may start seeing more of those web services be made available on a members-only basis. IMHO, the line should be set such that the things that benefit Amateur Radio as a whole are on the public site, while those things that are a help to an individual ham should be a membership service. IMHO, however, helping new hams get started is for the Good of the Service, so that info will remain public. Over the coming months, I may be moving some of the QST reprints on the TIS page to members-only.

This last dues increase did drive home a point to me that the work ARRL does that benefits all hams (the RFI program and the web pages are excellent examples) is being funded by members. Those non-members that make use of those services should at least send an ARRL member a thank you. :-)

>Yeah, I read that shortly after it appeared, good example of what can be
>accomplished.

Yes, but it is also a good example of what kind of information about ARRL activities should be made available to members. I will use my own work as an example because I can criticize what I haven't done without offending anyone, I think. :-) I did not write up or publish the papers I presented to the T1E1.4 VDSL standards committee, nor describe much about the work I have done with the HomePhoneNetworking folks that helped them include a notch from 7.0-7.3 MHz in their product specification, although we did feature a web piece on some of the testing we did over Thanksgiving weekend. I could go on, but the point is that, IMHO, ARRL has not done a good job communicating this sort of thing to its members. I can give you my excuses -- I moved on to the next emergency. Fortunately, one of the justifications I used for hiring someone to tackle RFI to hams head on was that it WOULD give more time to document the work we do; as a Member, I want to know as much as I can about ARRL's advocacy work. It is THE principle reason I am a member, even after the Board may set a policy that I would have preferred to be set differently. Relatively small details about the choice of words in the recent Board resolution pale, IMHO, in comparison to some of the critical work being done to protect spectrum. (Protection from noise from unlicensed devices is almost as important as keeping the allocation.)

>From: Brian Kelly kelly@dvol.com

>These computers are hideous RFI generators, nag
>the FCC, this is ridiculous.

You may not know how ridiculous. A "legal" signal from an intentional radiator on 3.5 MHz would be S9+15 dB to a dipole 100 feet away. This isn't going to change, unless Amateur Radio can document widespread interference. The complicating factor is that there are other rules that stipulate that if harmful interference occurs, the Part 15 device operator has to correct it. In cases like the AT&T PX-421 modem jack problem, AT&T is doing the right thing. So far, 90% on the recall. Can't take THAT one to the FCC. What the ARRL RFI Task Group tasked me to do is to identify several clear-cut cases where there is actual harmful interference, and an operator who refuses to do the "right" thing. We are then going to take them to the FCC. IF the FCC will enforce the no-interference clause, then it can be relied upon. If not, then we cannot live with the limits.

See http://www.arrl.org/tis/info/part15.html for ARRL's info on Part 15 devices. Don't tell Len; he gets very unhappy when I post the URL. :-)

Sure it was stated by me, when I said "per annum" the first time. I thought that was a well understood term. I've since found out that there are some on this NG who don't understand it.

> Without the qualifier, the
> one-time hike is much steeper.

But the qualifier is necessary if you want to make a valid comparison between the dues increase and inflation. You can compare the anual rate of inflation to the per-annum dues increase, or you can compare the total inflation since 1997 to the percentage dues increase. In neither case is the result "outrageous" as you initially claimed. It only looks outrageous if you compare the total dues increase to the annual rate of inflation, but doing that ignores the years in which there was no change in dues and thus distorts the truth.

So his view may not really matter. He is after all there to represent the
membership. So writing lets him know what at least one ARRL member thinks.

> Tom Frenaye already knows my views, but I took the time to

If it's well documented, etc. I would expect Riley would move on it. The problem I see with it is that the FCC can readily spank an owner of an RFI source but there are two perps involved. One being the owner who refuses to go QRT which the FCC can shut down, the other is the manufacturer of the widget who probably sold a jillion of the things. Gets very complex but it's absolutely gotta be done. I vote for getting the limits for Class B devices 'way down, kill it before it shows up on the shelves and be done with it.

I agree. Gets right back to the concept of monthly staff reports in QST. Provide a brief summary per department or noteworthy invidual's news in QST povide the the link to the full text stored in the Web server. Or something. Needs to become a regular column. It'll be a lot easier when QST is published on CDs.

Oh, these boils over BOD policy decisions are even nuttier, they've been underway the whole half century I've been aware of what's up in ham radio and the sky hasn't falled despite the sporadic uproars. Ham radio has only gotten better over the years, most of the beneficial changes started with BoD decisions and mandates. I agree, my subsciption to QST is not why I'm an ARRL member.

> outrageous.

So are you now saying that the dues increase is outrageous even if it doesn't exceed the amount of inflation since 1997? Or are you saying that the rate of inflation since 1997 on a per-annum basis and the total inflation since 1997 are unrelated? (!)

Frankly, I think you are now in the Cecilian position of trying to reinterpret your original words to mean something other than what they say.

If that's fact I think it's far more due to today's dumbed-down FCC than it is with anything the ARRL has or hasn't done. I think it's been pretty clearly demonstrated that the FCC could care less about ham radio. The whole history of the FCC with respect to ham radio over decades has been a litany of disengagement maneuvers. When it comes to changing the regs the first thing the FCC seems to do is ask itself "First priority, guys: how can we jerk this R&O around to make life easier for US?" Once that's decided they pay cerimonial attention to commenters like the ARRL.

Over a long period one can save a huge number of dollars for dues. I forget when life memberships became available, 1970 or so?? Dunno. I think the original cost of a life membership was around $150. If those numbers are in the ballpark a ham who bought a life membership in 1970 paid roughly $4.83 per year this year and it keeps getting lower the longer he's a member. In the limit it becomes essentially free. Depends on whether ya wanna grunt now and buy one as a long-term investment. Very long term.

Ed: I agree completely with your remarks, with the everpresent caveat
that the applicant must actually read forunderstanding and answer the
questions on that basis.

I have downloaded the entire current question pool, and am
disaappointed to find that, alas, there are very few questions
presrented in the sort of format of those few that you posted a few days
ago.
My wish is that a far greater percentage of the test questions would
be formatted in just that fashion. Were all the tests to be redone in
that way, I could agree completely that the tests were indeed a valid
assesment of the applicants knowledge. But you already knew that.

Awhile ago I said this to the ARRL webmaster.

Whoever is setting the policy for the ARRL web site has it perfectly
backwards.

The main page, open to members and non-members alike, rivals QST as a
source of the latest news in ham radio. It is well done, timely, and
attractive. Just the sort of thing we're willing to pay our dues to
have. But we don't need to pay any dues to see it.

For those of us who pay dues, there is a "Members Only" news area. It
contains lame things like Stan "surfin' the web", "youth@hamradio.fun",
etc.

He wasn't impressed, and nothing changed. The "members only" side is
still lame.

Good luck on this one now!

I think it would be best to have the largest number of technical hams possible in any time period. But that's not what I was commenting on. I was comparing the 50's era average ham's technical abilities to the technical abilities of today's average ham. I think the 50's average ham wins hands down...

>non-technical hams (I don't even know how you would define that --

Perhaps it's similar to what one judge said about pornography. It's hard to define but you know it [a tech-ham] when you see it... :-)

>perhaps you could keep asking them on usenet if a test
>that doesn't test knowledge is a [good] test)

They would probably answer the question the first time I asked it. Unless of course their answer would undermine their own position on the validity of today's ham tests... :-)

There's another aspect to the whole scene. The ARRL site is very much in
competion with other ham website which was not the case just a few years
ago, as in QST and the ARRL are faced with a whole new ballgame as far as
necessarily being the primary attention-grabber and "source of all good
things" vs the good old days. Hell, dial into the ac6v site and you have
more ham radio than you can deal with.

I have too many other activities going on to take a trip to
the New England area, Ed. If we could make it a red
trout dinner (dessert optional) then I know an excellent new
restaurant in the unlikely place of Green River, Utah, that
serves a most delicious red trout. Call it a "middle
ground." :-)

The bet is on for the middle ground payoff. I say there
will be some kind of major change, but not what you
expect.

I was surprised the BoD even put it on the table!

>> Yes, a meteor can fall or aliens invade the earth...
>
>My views have gone through some evolution over the past 4 years. Every
>single Director who serves on the Board now will be facing an election cycle
>over the next 3 years.

As a non-member of the ARRL I am not obliged to any "Director."
Not to any "Board," not to any "official" of the League.

As a citizen of the USA I have elected government officials who
will get my input plus organizations of the US government who
make laws and regulate various things. I am not concerned
with "elections" in private organizations. In fact, I won't depend

on ANY private organization to "cast any ballot" of any kind for me.

>Do you believe that ARRL's concerns about the overall health and well being >of the Amateur Radio Service are not int the best interests of its >membership?

I would presume that the membership has already chosen which "side" they are on and simply let the League do any lobbying for them while they play with their radios. Those that are in the upper echelons of the ARRL, particularly the BoD, cannot be said to be completely altruistic as to the overall health and well being of the US ARS. They are not a government yet they put on trappings and organizational structure as if they were a pseudo-government. That's a ready-made environment for individuals who can afford to not work for a living and also experience the heady power of control over a membership of 170 thousand plus. Control is a subtle drug, Ed, once achieved it is hard to let go.

I'm not saying anyone on the BoD or in upper echelons is like that, Ed, just pointing out the what COULD happen. That DOES happen with elected government officials and private organizations do not have checks-and-balances and laws against them close to elected government officials. Why can't it happen in private organizations?

The ARRL BoD makes policy of the ARRL, Ed. That policy influences all output from the ARRL, everything from news-letters to QST to the website to legal representation and lobbying in Washington, DC. Everything. If some members did not agree at first, the inundation from ARRL material will eventually bring them around, even if in a state of ennui.

At this point you are no doubt planning a response which will place the ARRL in the best possible light. That would be "spin" but you will argue it is not. :-) Save the effort, please.

>I also think that the overall health and well being of the >Amateur Radio Service are what is good for the ARRL.

Non-sequitur. Voting membership in the ARRL can only come from amateurs already licensed in amateur radio.

That brings up another point. The ARRL seeks to determine amateur radio licensing requirements through policy statements and lobbying in DC. It is rather obvious to those NOT members that such influence by already-licensed amateurs (in the membership) would have them set policy so as to keep requirements that the members met. That is simply human nature...and the continuation of hazing rituals. If They had to struggle with some requirements, then,

by Hiram, everyone else must also struggle (to be as good as
They are now).

You say they don't do such things? There's evidence all
around that they do. Look at the whole morse code thing,
from use to license test (never mind that some have fun with
morse code, people have fun with all kinds of stuff). Those
who struggled to achieve proficiency in morse code once
are now older, more set in their ways, and have the time
to want to continue with it. Those favor the morse code and
are more inclined to favor keeping it. After a couple
generations plus publishing influence favoring that, there is
a de facto "standard" that morse code somehow MUST
continue as the prime standard of excellence of amateur
radio. Those that favor such become self-styled
episcopates who continue to promote their singular skill.

It takes an enormous act of intellectual struggle to overcome
a personal favored skill in order to look at the broader
picture of "all amateur radio" and attempt to see what other
(lesser?) people favor. Why should the episcopate care?
They are now in their "senior" years and wish to enjoy what
they have accomplished in their youth. They can afford to
lay back and do not wish to struggle with new environments,
either physical or mental.

I congratulate the BoD on achieving a modicum of success
in enough (not all) overcoming their personal desires and
realizing a future that is not how they wish it to be.

>> >The Board dealt with the international treaty now because now is when the

>> earlier. Stating that time-now was "the time to act" looks
>> more like a rubber-stamp approval of whatever the BoD does.
>
>I agree; in my personal opinion, two years ago would have been better. Would
>the Board have reached the same decision two years ago? Did it?

I cannot divine what is in the minds of the episcopate, that
group of "bishops" who would set out standards of everything
for a congregation. Everyone can only surmise their actions
based on past decisions...which has been rather constant in
certain things since the apostles first gathered in 1914.

Now how can you reasonably expect non-members and the
unlicensed to be dictated to in regards to overall amateur radio
policy? What made this episcopate divine? They did. They
struggled from a simple oligarchy to a virtual religion
complete with dogma and icons and faith (see "Amateur's

Code" number 2).

Keep in mind that not everyone was baptized into some amateur radio faith in their teen years. Patronizing attitudes of past BoDs "We know what is best" for amateur radio or any other thing does not sit well with adults capable of independent reasoning and experience. It is only accurate to say that past BoDs "know what is best for themselves." By demonstration.

You have to keep tuning in to find out yes or no. :-)

Why do you think that everyone MUST have some sort
of personal reason to argue anything? Isn't the effort of
modernizing amateur regulations enough? Amateur
radio is a hobby, not a lifestyle. Or is it?

Is freedom in an avocation such a dreaded thing? Must
avocations have a strict regimentation in everything such
that some consider it a surrogate military service?

>(This is not meant as an insult or a put down in any way.)

Could have fooled me. Even if you are sincere, AJ, there
are plenty of frustrated hams who would jump at the chance
to slam somebody, anybody who isn't a lodge hall member.
They have, they are almost eager to do so. You've seen
their output in here. :-)

Tell me why I should bow down to these self-professed
"superior" individuals who want to dictate morals, ethics,
jargon, and activities in a hobby? We are talking dictate
as with a heavy hand, whip, chains, the whole S&M bit
if one doesn't do as they order...and then respond by
saying "Thank you, sir, may I have more?" Noooo, not
that way, AJ, no thanks. Another way, maybe, but keep
tuning in...you never know? :-)

One doesn't NEED a computer interface, doesn't need any UHF
TV tuner for a front end, doesn't need a computer-specific
interface unless fancy display lettering on the display that will
print to any computer printer. I've seen two, used one such
PC Card type spectrum analyzer and both versions suffer from
inaccurate and limited logarithmic range.

The Log-Amp-Detector from Analog Devices solves the log
range and accuracy problems. What was once a large PCB
full of certain semiconductors and precision resistors is now
collapsed into one package. The VCOs for the first LO
sweeper are off-the-shelf from Mini-Circuits. Front end filters
can be almost kluged together out of what parts are in the
junk box. This isn't rocket science gee-whizzery.

>the extent of their usefulness.

Then you haven't used anything with more than 20 db dynamic
range. I agree that the old-style 1940s Panadaptor wasn't much
good with its semi-linear (not logarithmic) vertical display.

What I was talking about is an indicator of signals going from
S1 on up to 40 db over S9 on a display without needing to
change knob settings. You would be able to see "weak
ones" pop up from the noise floor, see how far they were from

your current frequency, then tune over to hear them as fast as you could tweak the tuning knob. No searching around, all the signals within sweepwidth settings are visible. 50 or 100 KHz sweep width no problem to see CW or any other kind of modulation on those incoming signals. Everything is on the display at once. A 1960s consumer-electronics item this ain't...none of those had as much as 60 db of accurate dynamic range. With some extra work, 100 db of dynamic range is possible (but one has to start thinking of using a display larger than 5" diameter to ease the eyes). Analog Devices has a stock Log package that can handle 100 db.

Sound interesting? :-)

>http://www.science-workshop.com/Joe_Carr%27s_NV_article.htm - Poor man's
>spectrum analyzer

I saw the two-part ARRL TIS web-reprint. Too many parts,
not enough dynamic range, coupling of dispersion and
sweep rate not optimum.

Analog Devices has a choice of Log-Amp-Detectors which
have a bandwidth going beyond the usual MF-to-VHF
analyzer needs in frequency response, but the available
logarithmic range goes from 40 db to 100 db. No trimming,
no fooling around with old-style discrete log-amp parts.
One (thin-film?) package, under $50 in singles (Analog
Devices will sell single pieces). That is the heart of a
spectrum analyzer.

The very same family of Log-Amp-Detectors can be used
to make a wide-range Power Meter that can measure
power input over a 60 db range (log readout) with direct
frequency input up to 1 GHz and a tad beyond...or a 40 db
input range that will go just beyond 1.2 GHz.

A Power Meter _IS_ a valuable tool for pro HF to UHF
folks. It could directly measure the output of HF to UHF
Local Oscillators. With a measured directlional coupler
it can also measure forward and reverse power of any
transmission line carrying a transmit signal.

>A tutorial on spectrum analyzers is found at:
>
>http://www.science-workshop.com/

Joe Carr is a prolific author but those instruments are about
as useful as the "DPDT Switch Wiring" alluded to by
another. The Agilent website has _several_ PDF files on
spectrum analyzer tutorials and applications and has made
excellent spectrum analyzer instruments for more than
four decades. All of those files are FREE for download.

The Agilent/Hewlett-Packard Application Note site has
plenty of information for all kinds of instrumentation and
measurement. Why go to the equivalent of a backyard
garage workshop when one can access successful
laboratories for accurate FREE information???

The "wall" is rather an obvious reference to the BERLIN WALL,
completed in 1961, then torn down beginning in late 1989.
[how quickly some forget...] A barrier manned by Vopos who
killed quite a few attempting to go from east to west.

The Great Wall of China was an ineffective "WPA" structure and
did not keep out the barbarian hordes...worked about as well against
warriors with scaling ladders as European castles against siege
engines. The Great Wall of China is symbolic...as the morse
code is symbolic of amateur radio excellence. Artifacts.

The last one I payed up was in Phoenix. I don't even want to tell you what it cost. :-)

> The bet is on for the middle ground payoff. I say there
> will be some kind of major change, but not what you
> expect.

I tend toward expecting that they will leave it alone. The biennial review is just that -- a review. They can meet the requirements and say that they think it just fine. I would guess, however, they would issue an NOI and see what changes the Service believes it needs, or that others feel are appropriate.

> I was surprised the BoD even put it on the table!

I wasn't; they said that they would. :-) I think being the one sole nay vote at the R3 IARU meeting some months ago had an impact. I chatted with a friend on the Board and the reason that there was any discussion of the US requirements in the resolution was to ensure that ARRL members understood that the policy change wrt the international requirements was NOT a decision about the US requirements. At some point, the Board will have to address that, but they could do so by changing,or affirming, the present policy. My guess? Three to four years away.

> >> Yes, a meteor can fall or aliens invade the earth...

> Not to any "Board," not to any "official" of the League.

As a member of ARRL, I am not obiliged to set my personal opinion to the ARRL Board, either. ARRL members may disagree with an ARRL Director, or even run against that Director in an election and throw the bum out. :-)

> As a citizen of the USA I have elected government officials who

Nor should ARRL members. ARRL members should contact their Director to shape the policies of the ARRL, but when matters come up before the FCC that concern them, they should make their own views known to the FCC through the formal commenting process.

> I'm not saying anyone on the BoD or in upper echelons is

> picture of "all amateur radio" and attempt to see what other
> (lesser?) people favor.

The possession or lack therof of Morse-code copying skills does not make anyone greater than or less than me. That skill is a plus, lack of it is a minus, but that can be said for any of hundreds of other skills that are important to ham radio, some more so than Morse code ability.

> I congratulate the BoD on achieving a modicum of success

> you used as an example.

They make something very much like that for small boats and have had such a thing for small aircraft for decades. They basically only scream for help on an emergency frequency that is located and monitored by satellite. If there is no need to state the nature of the emergency or the needs of the emergency, then the only thing to worry about is false alarms. These things are perfect for after the ship sinks or after the plane crashes and there are no survivors to push the button (totally automatic).

If you don't feel the need for a radio operator, and your oars are well tied down, what other emergency could you ever have? Which brings us to the awful question: Do you really need a radio operator at all, if you have a wife with a laptop, an e-mail account and a satellite account. Oh-Oh! There goes the battery again. Those satellite terminals are neat for truck drivers and everybody else for that matter, and I have demo'd a satellite phone that will operate anywhere in NA that looks like a laptop computer (antenna is in the lid) You open up the lid and move the whole unit around until the meter reads into the green and pick up the handset and make your call. There is also a cell phone that has an accessory attachment that contains a converter and satellite antenna that allows you to do the same thing.

Goodies like these would seem to make the radioman obsolete, but maybe you need someone on board to operate all these gadgets anyway. If that is the case wouldn't you want someone with a whole bunch of tricks in his arsenal, including ham radio and CW capability?

Wouldn't it be neat if life were like a bowling alley, where all life's messes are swept away and the pins reset automatically? But they still need someone to fix the jams on the pin machine.

What I'm getting at, If you can't depend on a telephone line, you probably need some kind of wireless intervention for your communications. And since no single device has the simplicity and versatility and operating procedures of the land-line telephone that we use every day, we will have to carry around a lot more than an emergency phone list. If I could only take one radio with me on the road, It would be an HF mobile and it would have CW capability because

I know what it is worth. If I could take two, I would add a cell phone.

With the additional provision that you also have to factor in "relative to the technology of the day," I agree.

The average ham of today may know more than the average ham of the 1950s. The highly technical ham of today probably does know more than the highly technical ham of the 50s, on average.

Ed,

I did my saving nearly 25 years ago and made a committment to the League
at the same time by becoming a Life Member in 1977 or 1978. My concern
is for those who are not Life Members. You can't say that I'm guilty of
the "I've got mine" syndrome. I've been a League member for all but a
few years (during some of my time in the Air Force) since 1964. Had it
not been for the (then) pathetic wages paid by the League, I'd have been
a staffer in 1975.

Buncha crap. The only stuff I'd leave in the free-access space would be material which promotes ham radio and ARRL membership, publications, etc. pretty much like it is. But TIS *absolutely* gotta be moved into the member's space. If I read one of his posts correctly, Ed is moving in that direction.

The explanation was in response to a statement that the dues increase was not justifiable with the present low rate of inflation. I really can't think of a better way to have resonded than to express the dues increase in terms of a per-annum increase.

Do you have any suggestions as to how Jon could have answered it better?

>
>I don't know whether you are not being forthright or are just forgetful
>in your old age. I did not seek any praise.

Sure you sought praise. You thought it was a clever idea...of yours.

You were indulging in relating a story of your expertise on
a government radio circuit, knowing full well that few on an
amateur radio newsgroup would have experience there
(with exception of a few ex-USN-radio-ops of earlier times).

Technically, switching over to CW from FSK TTY should be
possible but it is a most odd sort of thing to use as an
order-wire (a command circuit for radio circuit purposes).

You claimed the switchover was "necessary to synchronize"
the TTY circuit. TTYs have always self-synchronized since
the first Teletype Model 15s, whether on landline or radio
circuits. A Model 28 is no different in that regard.

On a following reply you stated that the "synchronizations"
were to "set schedules." That was illogical since, if the TTY
was operating correctly, it could be used as a TTY to send
schedules, copies printed at each end.

> I did not come up with the
>circuit. I simply used what was already in place. As I recall, you
>tried telling me that what I stated was untrue.

I said it was a dumb idea if you did it that way. I still think so.

While technically possible if the TTY transmitter also had OOK
CW capability, there were no technical justifications for this.
You seemed to be trying to get an "upper hand" in an on-going
argument in a newsgroup on the necessity to operate OOK CW
and preserve morse code testing for an amateur license.

You are now welcome to state why that particular switch from
TTY to CW was technically or opeationally necessary. For
any reason. It doesn't really matter but it will be interesting to
see the rationalizations and attempts to close with the last
newsgroup word. :-)

Sorry, Ed, but apologia for ARRL decisions criticized negatively
by others having opposite viewpoints is SPIN, or political
damage control. The ARRL BoD's decision on morse code
testing was political in nature (see following).

>> That brings up another point. The ARRL seeks to determine
>> amateur radio licensing requirements through policy
>> statements and lobbying in DC. It is rather obvious to those
>> NOT members that such influence by already-licensed
>> amateurs (in the membership) would have them set policy
>> so as to keep requirements that the members met.
>
>If it was "rather obvious," perhaps the League could have "rather obviously"
>not chosen its new position wrt international code testing.

No, Ed, RATHER OBVIOUS in terms of the last half century.

Note that the BoD did NOT make any definitive statement on
FCC regulations for amateur radio license testing...they simply
let it slide by saying it should stay the same. The change in
policy position was in regard to ITU-R S25.5, not Part 97. The
ARRL cannot vote in the ITU-R since it is not part of the
US administration party. The ARRL can be an observer and
advisor to the administration, but cannot itself vote.

What was decided was a POLITICAL viewpoint with relationship
to the IARU and other nations' amateur radio organizations...

with some relationship to influencing the USA administration
at future WRCs. Political viewpoints are expressed as Spin,
not as factual data.

>> Those who struggled to achieve proficiency in morse code once
>> are now older, more set in their ways, and have the time
>> to want to continue with it.
>
>I struggled with and achieved proficiency in Morse code, Len.

I wasn't specifically naming you in that regard, Ed.

As a GENERALITY of observation of human nature, those who
have struggled with something when young tend towards
retention of winning struggles with both ability and nostalgia.

What is dictatorial is that SOME who have achieved skill in
the past seek to impose the same need for all who come
later in time...especially so for morse code as an amateur
radio license test necessity when regulatory agencies have
stated that such skill is necessary for their license
determination requirements.

>> I cannot divine what is in the minds of the episcopate, that
>> group of "bishops" who would set out standards of everything
>> for a congregation. Everyone can only surmise their actions
>> based on past decisions...which has been rather constant in
>> certain things since the apostles first gathered in 1914.
>
>Getting a bit esoteric for me, Len. Can you restate that without all the
>fluff and 'buzzwords?'

It is not "fluff" or "buzzwords," but they ARE labels.

I was speaking in general to those who have a religious feeling
towards amateur radio and feel that the ARRL BoD is the
episcopate (a group of bishops) of "the church." The
"apostles" label is directed towards the supporters of the
first formation of the ARRL.

Some will not take kindly to such labels. TS. Neither is it
irreligious, but rather sarcastic. Again, TS. The almost-
religious devotion to the League by some is apparent to
others.

Don't buy any form of League membership if you care about the integrity
of your license or ham radio. The ARRL will screw you when your head is
turned. Buy a membership only if you believe that the natural progression
of amateur radio should be to become more like CB, for this is what the
ARRL board of directors believe.
The ARRL isn't working to improve anything. They say they're working to
protect your service but then they propose limp-wristed policy changes and
watch the service rot from within.
If you want to save ham radio, then cancel your League membership as
soon as possible if you have one. Don't be a part of the Leagues plan to
furthur dumb-down ham radio and don't support their slight-of-hand policy
changes which welcome ignorant operators and CB style operating practices.

Just ask Ed, They need to purchase new equipment for the tech lab when
they start doing product reviews on CB rigs, echo-mics, and amps.

I believe that the League's dues are a good _value_ for the price. The ARRL supports a similar level and type of activities as the IEEE. For the IEEE membership, I pay $113/year base rate (includes US Regional assessment), but excluding technical societies I choose to belong to. This is about 3 times the new ARRL dues rate for a similar type service. I just don't see how anyone can say that memberships are overpriced, especially when we see the League activities that benefit all hams. Now if we could just get more of those "all hams" to join :)

I believe if the League were to drop their opposition to elimination of mandatory US Morse cw testing, they could attract a significant percentage of the rapidly growing Tech class licensees. Especially if they were to offer a first-year, half price special. Give it some thought Jon. (I keep beating up on my Director about the code issue)

>>that path? I don't think Amateur Radio would survive long.

>Too bad your employer doesn't agree with your above statement Ed.

I must have left off what I believe to be the logical addition that, Vince; although I am certain that some hams will choose that path, I think it highly unlikely that most will choose not to learn within ham radio. Almost all of us here have learned a lot more than we learned to take our tests. I believe that a desire to learn is what motivates most hams to become hams in the first place.

Sorry I left it off, but I guess I didn't think it necessary to say it. I didn't mean to make you misunderstand.

Aaron likes to twist things, too, it would seem. Did you snip the middle part of Jon's paragraph because you thought it irrelevant to the discussion at hand? Did you not realize that the way you quoted it very much changed the meaning of the original statement.

Sure, and if I go camping, and something goes wrong, I would want someone
around trained in wilderness rescue.

>If I could only take one radio with me on the
>road, It would be an HF mobile and it would have CW capability because
>I know what it is worth. If I could take two, I would add a cell phone.

Depending where I was going, I would choose either a cell phone, an HT or an
all mode rig. If I felt using the all-mode rig, I would use SSB as my first
choice; it conserves battery power and in plain language, I can communicate a
lot of information in a small amount of time.

If all that failed, I would be glad I know Morse code.

I will add that, as a CW op, if I ran across the 1 wpm SOS from someone using a
lookup chart, I would stick it out.

>ITU treaty requirements.

I have little doubt that the ARRL Board will re-examine the issue when it appears that it will come up at the US regulatory level. I don't know what decision the Board will reach. That will depend on member input, I am sure. Rest assured, I will be communicating with Tom on a regular basis on a lot of issues, and this will be one of them. I would imagine that your note to Mr Race told him what you thought the results of the re-examination should be. The Board will probably re-examine it, but could decide to drop it, to keep it the same, or to ask for some sort of change.

My personal view is that the "Sohl" proposal, as I call it after his Correspondence piece in QST, to keep some code-copying testing in the exams, but include the results of the questions along with all of the other questions. That keeps code testing on a par with other modes that are important to amateur radio operation.

As a code guy, I think it is important that the applicant be exposed to the code from the getgo and that he or she be given as much opportunity to learn it as other modes. To me, this is probably a compromise position that both sides should consider.

Not necessary - any kid ready to "experiment" should
be capable of passing the codeless tech, even if by rote
memory. My girlfriend knew nothing about radio, and it
took her 2 weeks with practice exams to earn a perfect
score.

>> may be a dead issue, literally.

>But it could just as well go the other way, too. Hmmm?

I think so. The ARRL Board will have another interesting meeting, I am sure. Member input, now, and when it comes up again, will be important. I think the Board should hear from all sides of this issue. This time, however, I wish that they would hear from more people in the middle. With that in mind, I will tell Tom when I next bother him about this that although I express views, I don't think that Morse code testing is in the top 10 imporant issues facing Amateur Radio. :-)

If memory serves, the ARRL Board has as members 9 people who were not Directors
the last time the Board set ARRL policy.

>If you believe your opinion to be the majority opinion, it shouldn't
>take too much work to load the next board with pro-code-test people.

Or vice versa. Member input is important. I do know that the member input in
some Divisions was quite different from the member input in others. At least
one Director immediately recognized the "organization-based" input, with a
group of pro-code folks all writing at the same time, then a group of
no-code-test folks writing a bit later, as FISTS and NCI asked its members to
contact ARRL. :-) The hard part, IMHO, is figuring out how important this
issue is to the folks in the middle.

QRM, Steven has a valid point. Stewart may put forth
mostly silly ideas, but I don't recall any that weren't
on-topic to the extent that they involved FRS radio.

Your idea to have him post separately to each newsgroup
would certainly limit the number of responses we see,
but I imagine that he does not want that limitation.

Yes, and to the Board of other organizations that you think may also file
comments to the FCC.

Most important, though, is when this comes up as a rulemaking issue, whether as
a Notice of Inquiry or NPRM, make your views known to the FCC.

>>Can anybody tell me what are the benefits of becoming a Life Member of
>>the ARRL. Thanks

Please don't pay any attention to the rantings from Vince. He
apparently has a beef with ARRL. While the ARRL's policies may not be
agreeable to every ham, they are the only organization with any clout to
stand between the amateur community and the FCC and a Spectrum hungry
Congress that would love to sell off our frequencies to business users..
As for benefits to becoming a life member, kinda depends on your motives
and your age. If you're young, it's probably fiscally prudent. If you
wish to support the ARRL and its objectives, that would be good too.

>From: Brian Kelly kelly@dvol.com

>No freeloader access to info which only benefits them.

Maybe. There is significant value to having good information available on the public site, too.

A good analogy I like to use is a store. If the merchandise is not displayed, no one will know it is there. How much would you buy if you could only look at the outside of the box? How would you react if you walked into a store and the proprietor asked you if you had ever been there before and if you said no, told you you couldn't come in unless you bought something first. Not a warm welcome to a new customer.

What about help for the new ham? Is it not in the interests of Amateur Radio to help new hams get started so they stay hams? What about industry and the FCC and a host of others who look at web sites on amateur radio for a number of reasons. Should I make http://www.arrl.org/tis/info/rfi-elect.html a members-only feature? How about RFI in general, or the page on the RF-exposure regulations?

And should the public page not have news about Amateur Radio and the ARRL? Of all of the member-association sites I know of with members-only sections, most have significant public information. The "news feed" on all of these sites is public. I think that having significant public information lets a ham who may not know much about ARRL judge what the organization is, what it does and whether he or she feels it important to be a member.

And, from an organizationally selfish point of view, bringing hams to the site makes it easier to sell them books that help keep the cost of your membership down. :-)

> should consider.

Ed, it's hard not to bump in to CW on the air. I don't see why retaining a CW test element would expose one to any more CW than what they are likely to experience on the air operating. Opportunities to learn CW are there for the asking, tapes at Radio Shack, CW programs for the computer free on the Internet, CW practice sessions on the local repeater, and so on, so I fall to see how a CW test element can "improve" the "opportunities" much.

If a Ham likes CW they will learn it on their own, and will work at it to improve their proficiency. For those who don't, even force feeding CW can't stop them from spitting it out once the spoon is removed so to speak. It's really a case if you like it you use, you don't you won't.

>still lame.

Do you think the ability to download all of the Product Reviews since 1/1/1980 is "lame?" Do you think the Lab's Expanded Test Reports, up to 40 pages of additional data, charts and graphs from the Lab tests of rigs is lame? How about the parts of QST that are downloaded as soon as the magazine goes to the printer. What about the email-forwarding service? The QST/QEX seach engine that the ARRL Lab categorized back to 1970, with additional selected categorization back to the 40s and 50s? (The article Mid-Michigan Skyhook now comes up if you type in tower as the search word). DXCC awards listings if you are a DXer; a discussion forum about the Doctor column; a discussion forum that is the first step in determining what members want to see in the ARRL Educational and Certification courses.

I think, Hans, that your use of the term "lame" was not accurate. I am personally not very interested in many of the members-only features either, but the pages do have things of value to me.

There are three kinds of hams out here: Those who strongly support code testing, those who strongly oppose code testing, and those "middle people" who could care less one way or the other. So the Directors won't hear from those. The next brawl will be "The Second Battle of the Rabid Partisans". Like the Second Battle of Bull Run. With the emphasis on "bull".
>
I've been noticing much more widespread interest in the topic recently than we had while 143 was cooking. For one our Director actively pursued opinions on the matter going into the recent BoD meeting this time which he has not done previously. Yeah, it's still a hot topic. It ain't gonna be over until the FCC finally closes the matter for many years whenever that might happen some indeterminate number of years out. I wouldn't bet a dime on any of it.

>> We are then going to take them to the FCC. IF the FCC will enforce the
>> no-interference clause, then it can be relied upon. If not, then we cannot
>> live with the limits.

>If it's well documented, etc. I would expect Riley would move on it.

Actually, it may be better to take it to the Part 15 folks, but your point is taken. I am not so confident. What will the FCC do with the neighbor of a ham who buys a touch lamp at the local K Mart and causes interference.
I chose that example on purpose because in one very clear cut case, the FCC paid a visit on the neighbor after months of the ham begging. The FCC told the neighbor that he had to stop using the light, shook everyone's hand and then drove away. The van no sooner was out of sight than the noise returned. So far, no further action. That's one of the cases I need and I am going to use it. Another case involves a commercial wireless LAN on 2.4 GHz. The operator actually did the right thing and turned off channels -- until they realized it was the Amateur Radio Service. Jim Haynie is still working with the FCC on that one. That's two, but I can't promise how the cases will turn out. OTOH, the FCC has been good about writing advisory letters to electric utilities, as a followup to the letters I write first. (I hear from about 75% or so, with generally good cooperation, although 50-50 on the actual resolution.)

But how does a ham and the FCC tell the neighbor of a ham that the device he just bought at K Mart is being operated in violation of federal law?

> ... the FCC can readily spank an owner of an RFI source but
>there are two perps involved. One being the owner who refuses to go
> QRT which the FCC can shut down, the other is the manufacturer of
> the widget who probably sold a jillion >of the things.

Actually, there is only one perp under the law in most cases. The manufacturer is required to build the devices to the requirements of Part 15. Some devices must be Certificated -- the manufacturer or importer has to send test data to the FCC and the Commission approves the device for sale in the US. Others are "Verified," meaning the rules require the manufacturer to test it and keep test data if the FCC ever asks. (Really!)

Once those requirements are met by the manufacturer, the device can be sold. A "legal" device on 3.5 MHz can cause S9+15 dB to a dipole located 100 feet away. This is, of course, harmful interference if it lands on a frequency an amateur is using.

Even that may not be so clear cut. The definition of harmful interference requires that communication be repeatedly disrupted. The FCC has made decisions wrt cable leakage that merely hearing the signal (S9 is typically legal for a

cable leak) break squelch is not harmful interference. 145.25 the usual frequency, and if there is no repeater in the area, there is no harmful interference.

In my estimation, more instinct than fact, the FCC would not view an S1 or S2 signal on HF as harmful interference. S6+ almost certainly is. I don't have a clue how the FCC would view things in the middle. How about a signal that is a 1-second burst every few minutes? Harmful interference? How about the frequency agility that is a natural part of the Amateur Radio Service? Would the FCC feel we should use the flexibility they have given us to avoid interference that is on a single frequency? I don't know, but I could imagine that they would.

The real issue, however, is that under the rules, the operator of the device, ie, your neighbor, that local business, a school, is responsible for resolving actual interference. I don't know about you, but I sure would not want to have that conversation with my neighbor. He bought an arc welder at Sears and I gotta' tell him he is using in violation of federal law? He is a nice enough fellow under most circumstances, but don't think he would see things my way. Now what? A letter from the FCC? There goes my next tower variance, eh? And what do I say if he says, "So, the tables have turned, have they?"

> Gets very complex but it's absolutely gotta be done.

Complex, indeed. That is why Mark Wilson tolerates me in the Lab. :-)

> I vote for getting the limits for Class B devices 'way down, kill it
> before it shows up on the shelves and be done with it.

The ARRL fought that fight, and lost. I guess the big boys had more expensive lawyers. Realistically, unless we can show serious and repeated harm to the Amateur Radio Service, I don't think we have a prayer, and even then, I think we would lose. And, what the manufacturers say is that the rules offer complete protection against harmful interference; how much more protection do we want than absolute?

I can live with this,IF the FCC is willing to enforce the rules. I can live with ARRL having to take a lot of the first steps, in preparing information and in trying to resolve some of these problems with the device operators, IF the FCC is willing to take the last steps and deal with those cases where a reasonable cooperative effort is not enough. How that works remains to be seen, but if the FCC won't do it, I think ARRL's comemnts to the FCC may be very different the next time a high-level of radiated emissions is proposed as being okay because of the non-interference rules.

In the meantime, what can be done? Even with what it has for staff resources (me,part time on RFI), quite a lot. It all started with the old Phonex PX-421 wireles modem jacks on 3.53 MHz. Man, I can hardly tell you how much time I have into that one. It took over two years, but it is actually starting to pay off. Phonex did the right thing immediately, learning of widespread harmful interference and literally stopping production and making engineering changes in a few weeks. About a month later, a new model was in production, operating outside the ham bands. TCI, now AT&T, bought them by the thousands. That was the hard part. They were very cooperative on the national level, but had a lot

of local problems getting the job done. After a long while, they switched over to a 100%-recall mode, and are, in MOST sytems, 90% done. (The areas that are still behind the curve are San Francisco/San Jose and the Dallas area, but Dallas is coming up to speed pretty fast.) Whew!

Unfortunately, and fortunately, that isn't it. Other technologies such as VDSL, HPNA, and HomePlug threaten HF. Fortunately, that isn't it. I somehow managed to put togehter the web pages at http://www.arrl.org/tis/info/rfiteljx.html. This is, of course, seen by a lot of hams (not all of which are members... :-)). Many hams work in industry, so this info got the attention of those organizations. In many cases, work to protect amateur radio was already underway, I might add. The bottom line is that these organization are willing to address RFI from the getgo, and are doing so, to one degree or another. All 3 product specs contain at least 20 dB more protection for amateur radio than the rules require, with the very specific intent of preventing inteference to large numbers of hams.

Will there be cases anyway? Yes, there will, just like there are cases of TVI involving ham radio. But these manufacturers are voluntarily including protection, and they are going to radiate about 60 dB less energy in our ham bands than the rules permit us to radiate in our neighbors' TV bands.

Now, the real problem is probabliy 2.4 and 5.6 GHz. Can you say Bluetooth and wireless digital? There can be no protection added because these devices are using the shared ISM bands that we also share. The manufacturers know, too, that our use of the 2.4 GHz bands is a lot less than our use of HF, so the likelihood of *actual* harmful interference is pretty small. The ARRL's ad hoc Spectrum Strategy Committee is discussing just what CAN be done to help protect these bands. Asking for Part 15 rules changes may be one of the end results. The committee has been in place about 4 months or so, and just reported to the ARRL Board in January. As a "spectrum-strategy," the full report may not be made public -- no sense telling the opposition how we intend to defend the bands, but I will sed what I can shake loose for a public report.

>> . . . I did not write up or publish the papers I presented to the T1E1.4
>> VDSL standards committee, nor describe much about the work

>Lack of time?

Lack of time, on the the next emergency. That has to change, and I told my boss that. :-)

>I agree. Gets right back to the concept of monthly staff reports in QST.
>Provide a brief summary per department or noteworthy invidual's news
> in QST povide the the link to the full text stored in the Web server.

Even it only appeared on the web, it would be a start. Once I get my new staffer hired, and up to speed, I am going to have to get things documented. (Man, I hope I can find the right RFI guru in a tight employee market and a salary range that is not at IEEE standards. The saving grace is that this is a once-in-a-lifetime opportunity to work with ARRL, industry and the FCC to make a BIG difference in something really important. I will either get the semi-retired EMC engineer or the new grad who wants something REALLY impressive

on his or her resume.)

>A manger playing help desk is nuts.

I am a working supervisor, so I gotta' do something. :-) What I may continue doing myself, depending on the qualifications of whoever I hire, is the committee-level and some of the first-contact with industry and utility companies,etc. It has been working out pretty well.

>I'm a lot more concerned about losing spectrum space to interefernce than I
>am to
>somebody nipping pieces of spectrum space for use by other services.

ALL amateur spectrum is shared, most of it with Part 15. That sharing can protect us as well as hurt us; even the Part 15 folks are afraid of congestion on 2.4 GHz. Time will tell what can be done, but I, for one, am going to give it a go.

Anyway, I probably gave you (all) more of an answer than you wanted. To find out how many read this far, send me an email to W1RFI@arrl.org or W1RFI@aol.com. I will do a drawing of all those that do to award the 2000 "bent-cover" Handbook, now that I offered it to Aaron but he didn't accept the terms. I will add that you have to look REAL close to see the bent cover. But I did want to give a snapshot of what I have been up to over the past few months. The details are, well, a bit more detailed. :-) I figure that it is the least I can do after disagreeing with you so often on code testing. :-)

Not only "small boats". Every vessel required by law to carry
radio (all cargo vessels over 300 tons, all passenger-carrying
vessels) must carry an EPIRB. IIRC all aircraft licensed by
the FAA must carry an ELT (I may be wrong about the "all" but
certainly "large" aircraft are required to have ELTs).

>Goodies like these would seem to make the radioman obsolete, but maybe
>you need someone on board to operate all these gadgets anyway. If that

Replacing the old "Gibson Girl" or equivalent hand-cranked CW
transceiver, all lifeboats are required to carry two or more
battery-operated marine VHF transceivers to talk to the SAR
aircraft who are usually first on the scene.

BTW - the American Red Cross uses SATCOM radio-telephones as
its backbone communication in disaster services.

You are probably correct, but I also see no reason to completely eliminate testing for one popular mode on the tests. The method I described does indeed test CW, but to the same standard as other modes.

At any rate, this is the gist of what I believe today. Who knows what I will feel a few years hence.

Why? Most of the comments made to the FCC are by people seeking personal gain from the result. The FCC accepts that. Even if there is personal gain involved, and there almost always is, the FCC knows that it must make its decisions in the public interest. In general, I think they do.

><Vince> apparently has a beef with ARRL.

I believe the majority of his current disagreement is that he is not pleased with ARRL's position wrt restructuring (4 classes of license, 0, 5,12,12 wpm, and asking that more comprehensive written exams be given.)

>As for benefits to becoming a life member, kinda depends on your motives >and your age.

I think I can address what may have been the original question. Life members do not receive benefits that are any better or different than annual-paying members. It can be an investment in the future for some, a way of not having to bother renewing every year for others and a "contribution" to ARRL by others. The League does invest the life-member dues, to ensure that it is not building a house of cards. That life-member who joined for $125 back when $125 was a lot of money is still being funded from the way that investment has grown.

Do the math, consider your options and if you want to join the League, do it in the way that is best for you.

See http://www.arrl.org/join.html for info on dues and life membership.

Are saying that person petitioning his government to change a regulation
that he believes is not in conformity with law and not in the public
interest has no standing to file that petition?

The matter more or less before the Commission is complaint against the
political, legal and constitutional validity of a the Morse code exam
regulation. An attack against the petitioner is irrelevant.

Would you ask black women to be white before she challenges the a bus
seating law. Would ask a women to be man before she challenges the right to
vote. Must I pass a code test in order challenge the ITU rule S25.5 and FCC
rule 47 CFR 97.503(a)?

> (shocking!)
>

Not exactly, Jon. 'Per Annum' is Latin for "Each Year". You didn't exactly specify in clear terms which years you were referring to, so I made the assumtion that *future years* was the subject, since the future is the only time where the increase can apply - you're sure not going to collect arrears from the membership.
Turns out that wasn't what you were talking about, instead you were doing past-years' accounting. Until you made that clear it looked appeared to be a screening of the dues increase as a percentage, the sort of spin that is an everyday matter in society today, lamentable though it is. It's a routine business matter today. So it wasn't exactly my "ignorance" that was wholly to blame for the clash. Once your meaning was clear, my complaint dissipated. Let's just leave it at that.

Here's two:

1) Apathy. Many amateurs don't care about some other aspect of the service if it doesn't affect them.

2) Anarchy. Everyone simply does their own thing without regard to others. For this, I'm primarily thinking of the breakdown of the packet network (at least regionally), where cooperation is necessary but lacking. We're left with just a few "die-hards" (often called "blow-hards" by those who aren't in the network), who are aware that they're unappreciated and by themselves, cannot sustain an already fractured network. It gets worse with TCP/IP ops. However, with some of the jamming on HF, this could be a factor with voice ops too.

These two certainly lead to alot of corrolary problems such as in-fighting, the insult wars here on the RRA newsgroups, etc....

I certainly agree. The League's restructuring proposal was very much
appropriate and would have affected an orderly progression of the ARS.
FCC evidently didn't give it more than a cursory look.
I don;t know exactly when things changed, but it had have something to
do with retirements and massive personnel changes. Both ARRL and FCC are
operating with totally different personnel than in the dasy when they
collaborated closely in planning and making rules for the orderly
administration of the ARS. I doubt we'll ever again see such close
cooperation again. FCC has bigger fish to fry and ARS is a very small
blip on a very large screen.

Now that you've asked, he might have said something like "While the
increase is 14.7% per year, it actually amounts to 3.5 % per annum since
the last increase, which is not out of line with the rate of inflation".

Sometimes economy of words winds up costing many more. (Something I
soon found when attempting to shorten my own posts).

>>>So are you [ignorent] (shocking!)...

>Aaron likes to twist things, too, it would seem. Did you snip the middle part
>of Jon's paragraph because you thought it irrelevant to the discussion at hand?

Fair question. Lets analyze. Here's Jon's *entire* quote:

>>It's not an insult. Dick admitted he was ignorant of the meaning of the term
>> "per annum." Hey, I'm ignorant of lots of things. So are you (shocking!)

Have you seen Dick post that he admitted that he was ignorant of
anything? Have you seen me post that I was ignorant of anything?
"Ignorant" is not the nicest word you can use when describing someone,
even when using the word on yourself...

Of course Jon was referring to his earlier statement:
>>This is one of the reasons I don't hang around rrap much any more -- too
>>many people like Dick who (willfully? ignorantly?) misinterpret simple,
>>direct statements and then use their misinterpretation as "evidence" of
>>unethical behavior on the part of the other party. Guess my stomach for
>>idiocy like this isn't as strong as Ed's.

Translation: Dick (wilfully? ignorantly?) misinterprets my posts which
is idiocy. Idiocy? Would you like to hear that your posts are idiocy,
meaning of course you write like an idiot...

So Jon has effectively posted: Dick = idiot = ignorant and Cecil =
liar, all over a silly percentage argument... :-)

You may be right in your criticism of my quoting, but all in all, I
think I had Jon's flavor rather well. Question is, why do you take me
to task for my quoting, and yet remain silent on Jon's conduct? You're
not going to pardon your brother (employee) are you Mr. Clinton... :-)

internet
> became widespread?

Ed...
I would love to belive that ham radio is continuing to grow...
BUT
common sense tells me it is not capturing the interest of young people
and it is no longer advised as a worthy educational hobby by their
teachers or parents. We can not ignore the facts that show that ham
radio has become an old foggies' hobby, because only old retireees are
interested in using its facilities. Communicating by ham radio in the
way that the majority of hams (but certainly not all hams) are doing it
is not very educational...Nor do hams attribute appreciably to the
state of the communications art when compared to computer guru
hobbyists.
Ham Radio is sick and will get sicker unless its basis and purpose
is clarified and adhered to.
Because some public schools in the USA are not producing educated
students it has become a political objective to improve education in
general. Programs are being prepared that would test students'
achievements and teachers' abilities to teach. Bush warns that schools
which do not succeed will be closed. Programs involving school
vouchers, so that parents may select "better" schools may be impossible
to implement because either the voucher money offered will not be
enough or the good schools will quickly be filled and there will not
be "good" resources for all. The separation of church and state, as
interpreted froim our Constitution, had formerly prohibited federal aid
to parocial schools. IMHO this is a good idea because any inclusing of
religious teaching must be handled separately from all other teaching
to allow for the religious freedom that our founding fathers knew was
best for maintaining peace and dignity within our nation.
Why do I bring up the Educational Dilemmas that are now political
footballs? I bring it up because it has a lot to do with ham radio.
Some present political beliefs include:-

1) All children must be given a good head start early in their
education if a modern educational program is to succeed.
2) Children must be tested in all subjects at all levels to certify
their abilities and to make schools accountable.
3) Americans need more required education in math and science if the
USA is to remain competitive with other industrial nations.

Are we to believe these ideas???

I kind of agree with these needs and I think that our government is
prepared to spend some bucks to achieve them. Why not apply them to
HAM RADIO???
We could...
1) Restore a Novice License that would be at a level to motivate very
young children to become hams.
2) Increase the number of Ham License Classes and corresponding exams
bringing ham radio into the digital information age.
3) Add endorsements on Ham Licenses for those, who through self study
and practical hands on work, can demonstrate on exams that they have
learned applied math, science and technology and are an asset to the
USA.

Nah...
You will not agree with me because you only think that the ARRL will
get dues from affluent old foggies who could care less about the future
reputation of the hobby. They will rarely be able to get their own
grand children interested...but won't see that as a detriment to
working a rare island or rag chewing about their ailments...or
complaining about a few kilohertz that they lost in 1968 because they
couldn't make Amateur Extra Class.

Please keep thinking Ed...I appreciate the fact that you are answering
almost everyone who comments here...Please read what they are saying
with care before you jump to respond. For Ham Radio to survive in the
changing times of new technologies and challenges it must motivate
youth and their teachers...with progressively rarer exception, it is
not doing so!

Yep...
FCC Chairman Kennard has been replaced by the son of a general. I
dunno if that will mean anything as far as Ham Radio goes. The
political belief among present FCC leaders is that all of the public
must be given as much access to all of the bandwidth that the spectrum
and the information highway can provide. Should everyone have the
right to be a ham??? Without taking any tests??? Should ham radio
become Citizens' Multi-Band (CMB)??? What about content? Should hams
be able to transmit music, talk shows, political debates, antique
auctions, casino gambling, pornography? Why not:- The Internet does.
The Internet dotcoms do these things with the idea of making a profit.
Hams could volunteer to do them for nothing (as true amateurs). Maybe
it would be OK only if the Hams were women, minorities, Native
Americans or folks who can't speak English....because they need the
education???...or a better way to get equally represented???
I dunno. Maybe I've been listening to and watching too many

Congressional hearings.

Kids don't want to hear about any number of Ham exam queations. Why
should they? They are constantly reminded that Radio Shack "...has the
answers"...about cell-phones...at least.

Restore the Novice class with a simple oral exam.
Let Novices work ten meter stateside sideband short skip (SSSS).
Increase the number of license classes and exams for advancing hams.

> test CW, but to the same standard as other modes.

So you would propose that a CW test element be of the same weight as say a selection of questions on Part 97 rules? And a failure to pass the CW element does not automatically disqualifies the applicant from passing the over all exam? That could satisfy many, I would think, on both sides of the issue. If that's your position I can see where it could be a reasonable compromise, at least it's an interesting idea to think about.

> Sure you sought praise. You thought it was a clever idea...of yours.

Now you may be providing some ammunition for Steve's claims regarding truthfulness. I never made the claim that it was my idea nor did I seek praise. I pointed to it to U.S. Government use of morse. You as much as called me a liar over the issue.

> You were indulging in relating a story of your expertise on
> a government radio circuit, knowing full well that few on an
> amateur radio newsgroup would have experience there
> (with exception of a few ex-USN-radio-ops of earlier times).

I made no such claim regarding my expertise. Do you know what a person who tells untruths is called?

> Technically, switching over to CW from FSK TTY should be
> possible but it is a most odd sort of thing to use as an
> order-wire (a command circuit for radio circuit purposes).

We didn't switch back and forth, Len. We used CW on one frequency and ran the TTY circuit on a different pair.

> You claimed the switchover was "necessary to synchronize"
> the TTY circuit. TTYs have always self-synchronized since
> the first Teletype Model 15s, whether on landline or radio
> circuits. A Model 28 is no different in that regard.

I stated that CW was used to arrange QSYs, openings and closings of the TTY circuit. It was also necessary to confirm crypto used if that is the "synchronization" to which you refer.

>
> On a following reply you stated that the "synchronizations"
> were to "set schedules." That was illogical since, if the TTY
> was operating correctly, it could be used as a TTY to send
> schedules, copies printed at each end.

Huh?

It is obvious that you did not and do not understand what was stated.

> While technically possible if the TTY transmitter also had OOK
> CW capability, there were no technical justifications for this.
> You seemed to be trying to get an "upper hand" in an on-going
> argument in a newsgroup on the necessity to operate OOK CW
> and preserve morse code testing for an amateur license.

Different transmitters were used since one circuit used CW and the other
was the TTY circuit. My statement regarding government use of the CW
circuit was correct. No "upper hand" was needed nor sought.

> You are now welcome to state why that particular switch from
> TTY to CW was technically or opeationally necessary. For
> any reason. It doesn't really matter but it will be interesting to
> see the rationalizations and attempts to close with the last
> newsgroup word. :-)

I'll leave it to you to figure out the necessity for such operation.
You were not a State Department communicator any more than you're a
radio amateur.

> didit

Yep, been there and didit.

>the other. Or are we just talking rebellion for rebellion's sake here.
>

Jim:

We're talking about rebellion against government tyranny. And
just so you know, I believe we're about as far away from needing
any such rebellion as we can get -- so there's no need to be
nervous! However, a good way to judge whether or not such a
modern-day rebellion is in order is to see whether the government
starts making serious attacks against Constitutionally-guaranteed
freedoms -- such as the right to freedom of speech, or the
right to keep and bear arms. "Rebellion for rebellion's sake" is
the last thing law-abiding gun owners have in mind, and I, for
one, would be more likely to act to quash any such rebellion as
to be a part of it. When American citizens have the right to keep
and bear arms, that right, by itself, is a powerful check against
any possibility of governmental tyranny -- the same way that
states with liberal CCW licensing have experienced a major
reduction in gun-related violent crime. When "they" start talking
seriously about taking that right away, as they actually did in
England, Australia, and other Third-World countries, then it's
time to start seriously thinking about acting on such a "rebellion."
I'm sure President Bush isn't going to permit that to happen.
For the first time in eight years, I have renewed faith in my
government.

Jim:

That's just the way liberals think. They must impose a rigidly-
enforced double standard, because they believe themselves to be
intellectually, morally, ethically, and socially superior than those
over whom they rule. They are the true elite -- at least in their
own minds.

So, the next time you see some Environmentalist telling you
where you can't build a nuclear power plant, tell them to get
back in their Volvo and go back to their gated residential
community and play a round of golf -- because unless they
are living in a cave, wearing a buckhide union suit, and have
never pissed into porcelin, they can't tell you a damn thing!

The public already has access to all amateur frequencies. They can do so at high power, by passing the exams, or a low power, by using devices that meet the requirements of Part 15. All amateur spectrum is shared.

>From: Paul McCarron w1hzy@cybertours.com

>I have been a life member since it's inception, some 30+?? years ago. They
>sure lost money on me!!!

Not so, Paul, ARRL maintains an investment folio that is funded, in part, by the Life Membership dues it has taken in over the decades. While I am not at all sure of the exact relationship between the folio and LM dues, it is pretty clear that without those prepaid memberships, the money would not be there. The proceeds for the investments serve both to keep the investments growing to match or exceed inflation and as part of the annual operating costs of the League.

When you shelled out those beans so many years ago, that was a chunk of change, indeed. You could have invested it yourself and used the proceeds to pay your annual dues, just like ARRL is doing. In that sense, you have indeed paid and shouldn't see yourself as a money loser at all.

If the League were to spend LM investments in the year they are received, it would make the budgeting process a bit easier, but they would be building a house of cards that would soon tumble down. They have been fiscally responsible with Life Memberships, IMHO.

>So you would propose that a CW test element be of the same weight as say a
>selection of questions on Part 97 rules? And a failure to pass the CW
>element does not automatically disqualifies the applicant from passing the
>over all exam?

That idea, to my knowledge, was first proposed by Bill Sohl. He wrote a Correspondence piece for QST that the editor published, perhaps in 1997 or 1998 (Bill?) I agree with it as an excellent way to retain testing for a popular mode, but in a way that balances Morse more fairly against other operating modes and practices.

Right now, one can get all of the questions wrong on any other mode, even get all of the band-edge questions wrong or all of the safety questions wrong, and still be given a license. Learning Morse code to 5 wpm is not all that hard, and some applicants will see it as an easy way to get a few questions right.

>That could satisfy many, I would think, on both sides of the
>issue.

I think so. IMHO, the complete loss of Morse-code testing would be as inappropriate as the complete loss of questions about FM operation. The nature of Morse code is such that it really is not appropriate to ask questions like:

What is the optimum rise and fall times of a properly shaped OOK CW Morse signal at 20 wpm?

I think that many of the no-code-test folks object more to the pass/fail nature of the Morse tests than to the presence of Morse code on the exams. On the other side, I think that many of the pro-code-test folks believe that Morse is needed to address some of the deficiencies in the present exams (real and imagined, IMHO). Looking at it from these perspectives, I think we MAY have some common ground. Compromise exists because it has value to society; maybe we can all decide that reaching a compromise position is more valuable to us than being "right" in the never-ending debate.

If I read the handwriting on the wall (for what that is worth), I think that the no-code-test side could ulitmately prevail if it stands firm. But in doing so, without compromise, the rift between us will be made a bit wider and that would spiritually disenfranchise a significant segment of amateur radio from its bretheren and sisteren. I don't know what the price of that, but the only example I can see is the rift that grew after incentive licensing removed priveleges from people -- the hurt and anger continues to this day. IMHO, any compromise that is reached, both organizationally and in the hearts of those who are willing to set at the "negotiating table," will let us make changes in a way that minimizes any harm to amateur radio.

And don't fool yourself, there is harm to us all in all of this bickering. Fortunately, the harm is not nearly as bad as a shapshot of this highly polarized forum is. Most hams don't feel nearly as strongly as some folks here do.

The real trick will be "organizationally." I am trying in my mind to imagine ARRL, FISTS and NCI setting at the table, burying the hatchet not in each other. :-)

Before April 15, 200 a person could become an Extra and miss
every question on Part 97 rules except two question on the Novice test.

Apparent the rules were not as important a manual Morse code proficiency.

>
Might be interesting to dredge up the and check the EU technical requirements in this area as an example of tighter limits being just as viable on the market as the stuff we have here. The EU has consistently clamped down harder on the technical requirements in any number of cases than the EPA, NEC and FCC do here.
>

That's a big part of what the ARRL is all about. I can see this landing in the
courts given the way the FCC has backed away from ham radio. Nothin' like a lawsuit
to get a bureaucrat's attention.
>

The microwave bands are gonna be a real battleground and they don't look good.
There just aren't enough hams up there to stake an effective claim. But we'll see I
guess. I don't have clue one about that end of the spectrum.
>

High accuracy isn't a critical need in most ham applications particularly when
used as panadapters. Sorta like fish finders are lousy fathometers.

No doubt, but I'm not able to design one myself so I'd have to settle for some
kit or construction article or another. Which is definitely not one of my
priorities.
>

> Then you haven't used anything with more than 20 db dynamic

>
The utility in using a spectrum analyzer for ham receiving purposes is usually to
detect the existence of a signal, not to accurately measure it's amplitude or
frequency. Junk analyzers work fine in this kind of service, some being better

than others. When I need to get serious about spectrum analyzers for machine vibration work I wheel out a $5-6k calibrated spectrum analyzer. Bruel & Kjar makes one which cost $25,000 a few years ago. There are spectrum analyzers and there are spectrum analyzers.
>

> the signals within sweepwidth settings are visible. 50 or 100

>
Understood, I've seen good spectrum analyzers (vs. HO-10s) used to present band displays. On HF they're close to useless because of the junk and noise on any open band for one. In a contest all you see is one monster 50-75Khz wide spike. Spectrum analyzers simply are not a useful enough operating aid to bother with. One of the high-end Icom xcvrs has a pretty decent built-in analyzer but nobody uses it on an ongoing basis. The proof of the pudding is that if spectrum analyzers had any particular value as a receiving aid the things would be on every operating desk. I don't know of a single big-gun HF weak signal wonk who uses a spectrum analyzer and I kow a bunch of those. Using one to scan low-population VHF and UHF bands might be another story.

Why, thanks for the compliment, Dick. I do try to be exceptional. And
I'm sorry that you are no more technical now than when you took your
first ham exam. :-)

Exactly,and precisely why the problem will NOT be solved at that
level, since FCC refused to require manufacturers of Part 15 devices to
spend the few extra pennies on filtering.
When the Pt 15 NPRM was in process I wrote both the FCC and my
congressperson to insist that more be done to reduce the RFI that was
sure to come as result of the way it was written. FCC ignored me and
quickly convinced my congressman that there really was "no problem" with
it. That was a done deal long ago and won't addressed again. Ed's work
is probably the only effective force in place at all, and it is largely
educational, as we can see from here. And much of that education is
pointed at manufacturing engineers who have no clue about ham radio, it
seems.
Whatta scheme.

Dick

For about the tenth time:

I have repeatedly condemned all jammers on the ham bands. Regardless of
mode, frequency, test or license status.

The ones you keep obsessively focusing on are obviously a subset of
those I have condemned.

What is it about "all" and "subset" that you don't understand?

Maybe there's no word for "logic" in Texan.

Not really. It's perhaps more of a credibility issue.

> seating law.

No, I wouldn't. So are you claiming that you are being discriminated
against because of your race, color, creed, gender, or disability,
Larry?

CW is not used for anything other than an ID on the majority of radio
services. Hey, that's a _good_ use of CW, though.

> >But, you miss the point -- you're not tested on
> >being able to _copy_ SSB, AM, or RTTY as you are with CW

> "Copying" RTTY requires that you be able to read - that's tested by the written
> exam. Can an illiterate person get a ham license? I don't think so.

Automatic CW 'modems' are also available -- you can then copy CW by
simply reading. It just remains to make them more reliable due to
poorly sent code. But, then again, poorly sent ASCII or Baudot would be
the same.

> >(knowledge of
> >how the mode works, of which we are tested for the others, and knowing
> >how to copy the mode are two different things) -- you're tested on how
> >the mode works.

> AND on ability to "copy" it.

No one is tested on how to recognize RTTY by ear, now are they? Is
difficult SSB copy presented (phase shifting and other ionospheric
artifiacts can make copy difficult)? Nope.

In fact, someone who is deaf is able to get a license -- the capability
of copying SSB is definitely not tested then. Whether they are able to
transmit SSB (and, using computerized voice recognition software,
perhaps, they can receive it) is not limited, even if they can't copy
it.

> >CW is outdated.

> Why do you say that? Have you ever actually LISTENED to the HF ham bands?

The Amateur HF bands are a small minority of 'the great majority of
radio services' listed above. Sure, hams use CW -- but hams also use
outdated FM equipment on 2 meters, too, that no one else can use. The
reason for amateurs' existence is spelled out in the rules -- which
paragraph does CW Morse meet these days?

Yes, I have listened to the amateur HF bands. Do you take me for a
newbie?

> > Almost as outdated as spark.

> Not at all. Do you know when spark disappeared from the ham bands, and why?

The why is due to occupied bandwidth. The when was a very long time ago
(around 1924). The then new 'CW' method of sending code was much more
efficient, both in power and in occupied spectrum.

But you did know that I placed that clause in there as a troll, right?
:-)

If persued on technical merits alone, CW would be dead now, due to modes
such as PSK31 and MFSK16, which are more efficient and more capable than
CW Morse (or Vail, if you want to go there) code.

But ham radio has never been only about technical merit.

> > -- protected subbands are good, though.

> Agreed! In fact, how about this: Divide each HF band into 3 subbands, by mode:
> Morse only, digital, analog voice/image. 35/15/50% is about right. To use the
> Morse-only subbands, you have to pass a Morse test and a written test. All else
> requires only a written test.

I would go a little larger on the digital -- reference the recent PSK31
interest. And with automatic CW 'modems' (such as the contest keyers
many use), a test would really be superfluous -- but I wouldn't make it
a sticky point. 30-20-50, maybe? Or 33-33-34, even?

> Something for everybody.

Right -- something for everybody. No one forced to learn a mode they
won't use. Exactly my point.

Some of them might, not the one I used. About ten years ago I was recruited to skipper a rented 37' sloop to take a four day tour of the northern Chesapeake at the behest of a couple mahout type gents in my biz who are another generation up and didn't want to go it on their own (Actually, one of their wives told Hisself that there was no way he was gonna do any such stunt unless I was aboard. Pain in the ass. Lucky me.). The boat had a fish finder and a fathometer in the cockpit, they consistently disagreed about the depth by a bunch. To make a long story short, I got curious and actually dipsticked the bottom several times, the digital fathometer was always right on the money, the fish finder was out to lunch every time. In ten feet of plumbed water dockside at Annapolis the fish finder told me we had 16 feet and the fathometer told me the bottom was ten point something below it's transducer. Mud time if ya navigate with a fish finder as far as I'm concerned.

I take a great deal of pride in my abilities at Morse code.

That pride is not diminished if some other fellow can't beep as fast as I can. I'll bet he has something different to be proud of, like maybe the size of that bass he caught last summer, or how well his daughter did in her soccer game last night, or how well he sang in the church choir last Sunday.

I do believe that The Constitution guarantees equal treatment under the law.
That's why we don't have segregated rest rooms any more. If tested in court,
I do not believe the Morse code requirement would stand. I believe "ramps"
would be required for Morsely handicapped citizens just as they are required
for wheelchairs.

> The same battery you will use to power the HW-7, or a different battery?

The HW-7 could be operated a long time on any typical laptop battery. Typical laptop has a 2-4 hr operating time for the first year or two, but only if you keep it charged every other day (they normally draw some current even when turned off). The HW-7 and a great many other simpler QRP rigs are far less picky about their power supply. The VHF marine radio in the life-boat is a good idea, but you will need special batteries for these radios for a long shelf life, and they probably won't be useful until shortly before someone can hear or see the helicopter, and untrained people could have wasted the batteries long before someone was in range.

Which brings me back to the training aspect. Much equipment will be misused by untrained people, and there is no guarantee that any one would pay any heed to a trained person even if they survived the incident, but the idea behind Amateur Radio was to provide for a great number of trained people, so there would be a greater probability of trained people available in the event of emergency. There is no excuse for disregarding this issue in order to sell gadgets that purport to be useful to those who have no experience in their use.

You can have it both ways if you like, and you don't mind deliberately utilizing people with lesser qualifications in order to avoid Morse code. You stated that you would prefer SSB because it's faster. True It can be faster. I prefer to use any of the Digital modes for passing text traffic that I can maintain in my logs without extra handling. Voice modes are too slow because they require significantly more handling and must be transcribed anyway unless rumor and misinformation is your goal. It is typically required to slow down the traffic sent by voice to allow reliable transcription. This is inherent in CW operation.

SSB usually allows more fluid net operations and is requires less power consumption so it is best to have that capability, and since CW is fully compatible with SSB operation, it behooves one to be prepared to resort to or more fully use it rather than close the station early under adverse conditions.

The inefficiency of CW is in the baud rate, e.g. ~10 baud, compared to
300 baud for Baudot and ASCII. The effective baud rate of PACTOR II
with its PSK modulation is hundreds of times the effective baud rate
of CW.

I think gun related crime and government tyranny are two disparate things. But my point has been all along that arms in the possession of citizens is no longer a check on government tyranny. The balance of power is too lop sided. That argument is the weakest of all the NRA arguments. Don't get me wrong, Larry. I support the right to keep and bear arms. It's just with the present atmosphere of pressure to increase gun control laws, the NRA needs to put forward it's strongest arguments. There's not going to be another revolution, and it sounds really lame to talk about needing to be prepared in case of one.

> When "they" start talking

It would take a Constitutional Ammendment to eliminate the 2nd Ammendment. And if enough people were to vote to get rid of it, which is extremely unlikely in any foreseeable future, then you're going to be seriously outnumbered by the majority. The outcome would have been arrived at in a democratic process - not by government tyrrany - and you would be in violation of the law to start shooting at people over it.

> I'm sure President Bush isn't going to permit that to happen.

Heck, even Clinton didn't suggest that it should happen.

> For the first time in eight years, I have renewed faith in my
> government.

Hey man, the government is just the same as it was. Some of the names on the roster have changed.

I think you must have gotten hold of a clunker there, or the transducer
was cocked.

I have two on my boat, one at the helm and one at the forward fishing
station, and they are always dead-nuts on.

Don't leave the non-Morse-code Amateur accomplishments out it, Hans. I was far prouder of my first QST article than I was of passing my 20 wpm Extra. Those who operate the phone traffic net, or net control the SSB or CW county hunters net can be proud, too. To be more in line with the accomplishment of doing CW proficiently, the phone operator who uses proper operating techniques can be just as proud as you.

And none who have obtained amateur licenses as required by Part 97 and who conduct themselves on the air in compliance with its rules need make any apologies to anyone. In Amateur Radio, there is plenty of pride to go around and many, many ways to find it.

Did you hear about the proposed new Southgate, Ca. power plant? Very clean burning gas plant with all the state-of-the-art scrubbers; replaces a huge diesel truck facility currently on the site; reduces the annual tonnage of pollution emmission by a substantial margin; and the people turned out en masse - in the middle of an electrical energy crisis - to shout it down.

I think the reason in this case is the people feel as though their neighborhood, which is economically depressed, is being used as a dumping ground. They just use environmentalism as their excuse not to have the plant in their backyard. The little picture takes on greater importance than the big picture.

I'm not so sure about that. But, I appreciate your support of my
suspiscion about Larry's motivations here. ;-)

> The FCC accepts that.

The FCC gives equal credence, presumably, to all comments because they
are more or less taking an opinion poll. But personally, I prefer to
have experienced people making policy decisions for the Amateur Radio
Service. Most hams probably feel the same way or even stronger about
that. Also, it is my perception that most people don't like being
lectured by newbies in any profession or avocation. Just an
observation, Ed.

>disaster, not by how well we can raid ham store shelves.

Yet the histroy of contemporary communications by hams in an emergency is filled with use of modern equipment as opposed to "what survives". That is because the equipment that survives is more robust to begin with (IMHO).

Well my cellphone fits in my pocket and my HT (Icom T8A) isn't much
bigger. In my vehicle I have a 2m mobile that can hit at least one
repeater almost anywhere I might be able to drive my car.
I see no real value to having an HF rig in the car for emergency
comms. Perhaps I am missing something that isn't being stated?

>If all that failed, I would be glad I know Morse code.
>

The problem is, as you note, "if I ran across the...".
The reality is that there isn't any common HF assigned
emergency frequency that people (hams) might be able
to monitor for that unexpected emergency.

What the HW-7 lacks, however, is any specific frequency
stability/readout. In using the HW-7 you must hope
someone happens to just be tuning across the frequency
you are transmitting.

This is not true. N8WWM the poster is NOT N8WWM the person.
To prove this, I propose a test. At QRZ.com there is a page for every
member that you can put personal information on. The REAL N8WWM will
change the page by putting a new first sentence in. Go there now to see
the original page. I challenge the fake n8wwm@my-deja.com or
N8WWM@yahoo.com to do that. Of course it will be impossible. If you
email n8wwm@arrl.net, within 24 hours of 2200Zulu on 1-25-01, the REAL
N8WWM will send you the exact wording of what that first sentence will
be. AFTER 2200Z on 1-26-01 the this address right here will post the
sentence change in the profile on QRZ.
The ONLY valid address for N8WWM that has his callsign in it is
N8WWM@arrl.net. The FAKE N8WWM can't change that.

The real N8WWM will change the first sentence in his personal information at QRZ.com 24 hours from now. The FAKE n8wwm@yahoo.com and the FAKE n8wwm@my-deja.com of course cannot know what that change will be.
Email N8WWM@arrl.net to get the exact words that will be inserted into the qrz.com profile. N8WWM will email the exact words to anyone who asks for it within 24 hours of 2200Zulu on 1-25-01. The change will be made on QRZ after that time on 1-26-01. Immediately before the change you will get your email with the text of the new sentence from the address cbersarelosers@my-deja.com.
For some reason, N8WWM's call has been fraudulently "bootlegged" on the internet. Why didn't the moron bootleg an extra class call?

> spend the few extra pennies on filtering.

I think you are mixing metaphors here, so to speak, but the point is well made. The FCC does not require consumer equipment manufacturers to include filtering.

Part 15 is another story; the Part 15 rules cover devices that are either intended, or likely, to radiate. The levels that the FCC permits Part 15 devices to radiate are strong enough to cause Amateur Radio problems.

First, incidental emitters, such as power lines, electric motors, etc, have NO *specific* radiated or conducted emissions limits. They are subject only to the provision that they not cause harmful interference.

Unintentional radiators (computers, etc) do not deliberately generate RF energy, but they deliberately create RF signals for "internal" use. They are subject to conducted emissions limits (ie, how much signal they can put on the power line) on HF, and radiated emissions limits on VHF. The premise is that on HF, the case and intercabling on a computer is not a good antenna, so the energy conducted on the power lines is the determining factor. In practice, cases radiate, and by my calculations, if the residential electrical wiring has about -30 dBi gain, the legal conducted limits are about S5 at a nearby HF dipole 30 meters away on 3.5 MHz. Generally, the manufacturers have to include some filtering. To put it into perspective, the legal limit of 250 microvolts conducted energy is 0.00125 microvolts, generally conducted into a pretty poor antenna -- residential electrical wiring. Compare that to the 50 milliwatts you are permitted to radiate for harmonic or other spurious energy, into a good antenna. The computer system in your neighbors house needs to be be about 76 dB better than your station, before we even consider how much better your antenna works as an antenna than his electrical wiring. Food for thought before we get too critical of the industry.

Intentional radiator are a bigger issue. The concept of filtering doesn't apply there at all -- they are designed to radiate. About S9+15 dB on 80 meters, by my calculation. On 2.4 GHz, things are actually better due to increased path loss, but nowhere near perfect. There have been some NTIA spectral studies that show a distinct rise on the "Part 15" portion of the 2.4 GHz band in urban areas. At this stage, I don't know if it from the legal wireless devices, or if people have added big antennas and amplifiers, raising the noise more than the rules intend. ARRL has a couple of cases of actual interference, both of which are before the FCC.

> When the Pt 15 NPRM was in process I wrote both the FCC and my

> sure to come as result of the way it was written. FCC ignored me and
> quickly convinced my congressman that there really was "no problem" with
> it. That was a done deal long ago and won't addressed again.

ARRL did too, with the same effect. And, in one sense, the FCC is right. 99 percent of the Part 15 devices do not cause harmful interference. Unfortunately, 1% of millions of devices is still a lot.

> Ed's work is probably the only effective force in place at all, and it is

> pointed at manufacturing engineers who have no clue about ham radio, it
> seems.

Yes, but, as amazing as it is, that education is having an effect. As I said in my lenghty post, the Home Phone Networkiung, VDSL and HomePlug specs all have notches to protect ham radio. It was NOT me alone that did it, but I have no doubt that had ARRL not been involved, it would not have happened that way. There are concerned hams who played pivotal roles on the VDSL committees, HPNA and HomePlug, and it would not have happened without them, either. It is a process of teamwork and cooperation, because under the present rules, that is about the best tool we have available. All good things do NOT come from Newington, CT, and in this area, I will continue to do what I did when I put the RFI Book together, draw on the best of the best of amateur radio to ensure that the end result is what is best for Amateur Radio. Fortunately, among those best are people who are willing to give, helped by others willing to support it. I tell, you, Dick; if you had told me three years ago that if ARRL asked the industry to do the right thing, and they would do so willingly, I would not have believed you. Even I have heard the whirl of the 'copter blades from time to time.

Will it always work out that way. I don't think so, but, IMHO, it was critical to get some successes under our belt, to demonstrate to the FCC that cooperation to avoid harmful interference works, and that it is not the exception. The first industry group that asserts that cooperation is not possible is going to have some powerful examples tossed at them. And, btw, the industries involved here are giants -- Lucent, Microsoft and the like are the key players on all these committees. The ARRL RFI Task Group meeting was hosted at Lucent, by Steve Strauss, a Lucent engineer and a member of the ARRL RFI Task Group.

> Whatta scheme.

I'm not sure how much of a scheme. In some cases, the right Part 15 sharing partner can be an asset. Remote control and similar devices often operate legally on 433.92 MHz. They typically transmit a few milliseconds every few minutes. That part of the band is already "occupied" by devices with a range of a few hundred feet at best, with signals that will sound like a fast dit to us. Harmful interference? The FCC probably would not think so. Will other, more harmful, Part 15 devices be likely to occupy this part of the band? Probably not. How about 2.4 GHz and the Bluetooth threat? Those devices, short range, will be around in the millions in a few years. Can we justify not allowing them there based on occupancy of 2.4 GHz? Probably not. Can hams adopt these spread-spectrum devices and fight fire with fire, using broadband technology to make use of that part of the band occupied by broadband technology? Sounds like it; maybe that is where some of our future is.

I don't have all the answers, Dick, but I am taking the support of people like you and me (I pay dues, too, just like you) and using it to keep at it. Each committee meeting I attend costs about $1,000 or so. Factoring in the expense of producing QST, I estimate that about 50 people are members to send me to one. Man, I hope that it is MY membership that pays for the ext -- sounds a lot more glamorous than helping to pay the heating bill. You and I both disagree with ARRL on issues like Morse code testing, in opposite directions, I am sure. But THIS sort of thing is what is really important. Little LEO threats and ground-imaging radar threats on 70 and a host of similar ones to come down the pike are going to make us or break us. I gotta' say, Dick, that as far as I am concerned, any one of these justified my dues dollars for 2001, increase and all. And I get QST, the Web and such besides.

So when you do what I do; re-up in spite of some differences of opinion, let me know. I will personally thank a League member for helping to make it happen.

D. Stussy <kd6lvw@bde-arc.ampr.org> wrote:

> 1) Apathy
> 2) Anarchy.

Let's add to it:

3. Spectrum threats
4. Spectrum sharing - (Part 15)
5. CC&Rs
6. Zoning restrictions
7. RFI to consumer electronics
8. Declining numbers (possible after the NC Tech's start expiring)
9. Insufficient Elmering of newcomers
10. Unresolved repeater coordination issues
11. Amateurs losing ground relative to changes in technology
12. Rising noise levels
13. Inadequacies in the content of written examinations

Somehow, I still wouldn't put "Lack of sufficient Morse code testing" anywhere except the bottom of this list. Others' mileage may vary, but I would strongly disagree with anyone who put "Lack of sufficient Morse code testing" near the top.

If you want to remove "almost anywhere" from your sentence, you will need an HF mobile. Murphy might strike when you're "almost anywhere"...

>I see no real value to having an HF rig in the car for emergency
>comms. Perhaps I am missing something that isn't being stated?

It depends on where you plan to go. Stay on the interstates and in the cities and a cell phone should do it. However when I'm heading across the Navajo Nation on my way to Colorado, the HF mobile is comforting...

>The reality is that there isn't any common HF assigned
>emergency frequency that people (hams) might be able
>to monitor for that unexpected emergency.

That's what the tuning knob is for. Just find a QSO and break in. Most hams will be happy to make that emergency call for you...

Is this the K3LT "broken leg and the wife is screaming" scenario? HF always gets through? Or is it CW always gets through?

Weren't you on the other side of this argument last time?

>frequency. Junk analyzers work fine in this kind of service, some being
>better than others.

If all you have is junk equipment, then all you do is junk operation.

Junk spectrum analyzers existed as ready-made equipment for a
long time. Their dynamic range never got beyond 40 db and the
accuracy, to be kind, was seldom better than +/- 5 db on a log
scale, if you were able to get one with a log scale.

>When I need to get serious about spectrum analyzers for machine
>vibration work I wheel out a $5-6k calibrated spectrum analyzer. Bruel &
>Kjar makes one which cost $25,000 a few years ago. There are spectrum
>analyzers and there are spectrum analyzers.

Back 20 years ago one of the semiconductor makers had a kit
containing a many-bit A/D and a pre-programmed microprocessor.
It was an audio range spectrum analyzer whose output could be
displayed on any oscilloscope. Was better than 30 db in
dynamic range and covered DC to about 20 KHz. Rocketdyne
Instrumentation Lab got one and it worked very well. While
considered a curiosity back then...it used FFT techniques to
do the transform from amplitude-time to amplitude-frequency...it
was a precursor to what now exists in consumer electronics
music systems selling for less than $200 for the whole music
system.

Navies of the world that use sonar have a form of such a spectrum
analyzer (FFT for analysis of the sonar signals) for over 30 years.
The same goes for some Electronic Warfare systems for good
discrimination among several signals. Those are also spectrum
analyzers.

I'm not talking about an all-purpose instrument with laboratory
quality and accuracy. That's not needed in this discussion.

>> the signals within sweepwidth settings are visible. 50 or 100
>> KHz sweep width no problem to see CW or any other kind of

>> modulation on those incoming signals. Everything is on the
>> display at once.
>
>Understood, I've seen good spectrum analyzers (vs. HO-10s) used to present
>band
>displays. On HF they're close to useless because of the junk and noise on any
>open band for one. In a contest all you see is one monster 50-75Khz wide
>spike.

Then the analyzer's bandwidth is way too wide. In all spectral
analysis there is an optimum bandwidth, sweep rate, and
band span of sweep tuning. That's been established decades
ago. In "modern" (less than 2 decades old) lab spectrum
analyzers, the selection has be hard-wired into the panel
controls.

A spectrum analyzer is simply a receiver with automatic sweep
tuning and display on a 'scope instead of aural output. The
bandwidth can be as narrow as 10 Hz to show just about
everything or as wide as 10 KHz to show "everything in a 50
to 70 KHz" span as one large spike. Attention to skirt
selectivity is a must, more critical than with an aural output
receiver...and related to the dynamic range.

>Spectrum analyzers simply are not a useful enough operating aid to bother
>with.
>One of the high-end Icom xcvrs has a pretty decent built-in analyzer but
>nobody uses it on an ongoing basis.

Now, now, Icom has been selling high-end models with built-in
spectrum analyzers for several years. The IC-756PRO is $3600
and the IC-R9000L (receiver only) is $9500. Someone is buying
them...

One reason spectrum analyzers are "simply not useful enough" is
the lack of dynamic range. If it has only 20 db range, it might as
well be a linear display. That range is useless. A range of 40 db
is better but still inadequate for practicality. 60 db is much
better but analyzer internal bandwidth filters start needing brick-
wall selectivity. 80 db is an optimum dynamic range in trading off
internal filter selectivity, logarithmic IF and detector range, and
everything else. You can relate the dynamic range to S units if
you like...80 db is practically the entire range of an S meter.

>The proof of the pudding is that if spectrum
>analyzers had any particular value as a receiving aid the things would be on
>every operating desk.

Heh, heh, heh...if morse keys had any particular value, every
radio amateur would have one on their operating desk... :-)

>I don't know of a single big-gun HF weak signal wonk who
>uses a spectrum analyzer and I kow a bunch of those.

...Hmmm...I guess that is supposed to settle that? :-)

>> Sound interesting? :-)
>
>Write the article.

I'm not. I know of two such projects already in the works, both for amateur radio use. One is upstate California, the other one is local to me. I'm in an advisory capacity in the group down here. It simply wouldn't do to have some non-ham be in the byline of such an article, would it? :-)

>praise. I pointed to it to U.S. Government use of morse. You as much
>as called me a liar over the issue.

Ahem...you pointed a finger back at yourself and then at the
State Department for "cleverness."

To switch over to CW for an order-wire or command context
from FSK is a *dumb* idea. Dumb technically, dumb
operationally.

>I made no such claim regarding my expertise. Do you know what a person
>who tells untruths is called?

Now, now, you are starting to sound like your buddy, the
USMC reject.

Dave, I called the procedure DUMB. Other folks in
communications have already established the methods
decades before you. You are free to call their methods
"wrong" but it is up to you to show why in order to verify
your claims.

>> Technically, switching over to CW from FSK TTY should be
>> possible but it is a most odd sort of thing to use as an
>> order-wire (a command circuit for radio circuit purposes).
>
>We didn't switch back and forth, Len. We used CW on one frequency and
>ran the TTY circuit on a different pair.

Ah, so the story CHANGES! Now, looking at it all in operation
and considering the methods, why does this CW-on-a-different-
frequency for an order-wire have more advantages than having
the circuit commands sent over the TTY circuit?

>I stated that CW was used to arrange QSYs, openings and closings of the
>TTY circuit. It was also necessary to confirm crypto used if that is
>the "synchronization" to which you refer.

I have to admit you might have me there, Dave. I've only been
involved with three different crypto methods of TTY, all over
military circuits, between 1953 and 1989. Without revealing
anything like a state secret or violating national defense, it is
safe to reveal that all of those military circuits self-synchronized.

No doubt State had another crypto system.

I might mention that secure Army field communications using
crypto digital voice do synchronization in real-time. There is
no need for any auxilliary "second channel" to "confirm" any
crypto settings. Such has been operational as the SINCGARS
family since 1988. It's also capable of frequency hopping.

>> I said it was a dumb idea if you did it that way. I still think so.
>
>It is obvious that you did not and do not understand what was stated.

Given a lot of text it is possible to "read between the lines" of
what a person writes. In the above case there seems to have
been some omissions of details. It's very hard to fill in details
by trying to read between lines there...

>I'll leave it to you to figure out the necessity for such operation.
>You were not a State Department communicator any more than you're a
>radio amateur.

Sorry, Dave, you will either have to explain your activity or just
drop the subject. While my only contact with State was a
quick time on RCA's RACES machine (State had two of them
for message storage-retrieval), you ignore that I've had some
thorough experience with HF communications and did it with
operating methods well worked out by others. Also on VLF,
LF, MF, VHF, UHF, and a few microwave bands.

I make no claims of expertise in communications methods,
technically or operationally. I can analyze and reason the
why and wherefore of how things are done and observe that
methodology of operation in communications done by others
before me.

There are few US radio amateurs who have any direct
experience with either State Department methods or crypto
communications. While I can understand your mentioning
such items in close proximity in the same message, they

are bogus for trying to make your case. [US radio amateurs are forbidden to use systems which obscure their communications...it's in the regulations]

The FCC issues US amateur radio licenses, Dave, not the US Department of State. You let me know if that changes, okay? Oh, and the FCC does not require any Commissioners or staff to hold amateur radio licenses in order to regulate US amateur radio or issue amateur licenses. Let me know if that changes, too, please?

No scenario, just a statement of fact/opinion... :-)

>HF always gets through?

HF SSB is the best *all around/all location* mobile rig for personal emergencies while traveling in a vehicle. There are few places that you can go where you cannot find a contact for any possible emergency communications. The same cannot be said for VHF/UHF...

>Or is it CW always gets through?

While I normally work 100% CW when I'm HF mobile, I always carry a mike in case of a personal emergency. IMO CW is the least effective tool for any emergency...

>Weren't you on the other side of this argument last time?

I think you will find this consistent with what
I have said in the past...

OF COURSE there is! Every state has at least one emergency frequency.
As always, you naturally assume that no one on a SSB frequency would
ever have any reason to use CW instead of SSB.

Forget Monica. Did you see Bill's eyes light up, and the grin on his face, when he saw those cheerleaders during his farewell ceremony? Heck, I thought he was going to get up and start chasing them right there.

Look, I'm all for enjoying the view of a nice looking woman (and, even more, the pleasure of a nice woman), but that man really needs to learn that there is a place and a time for all this (the oval office is not that place and a farewell ceremony is not the time).

Problem is that no one knows who may do what to whom or how. The
potential is ubiquitous. Not until interference shows up and detective
work tracks it down and ID's it can the beginnings of a solution take
place. Lame plan. The stuff is likely to be any and anywhere.

IMO this sort of activity is one of the most critical functions of
ARRL. If they don't do it it most likely won't get done. I'm sure there
are other similar but less sensational, such as CCCR's. When you gonna
go to work with the same effectiveness on that one?

My disappointment is not so much with either the ARRL nor FCC, but with hams who won't recognize the obvious - that there is a communications advantage in every ham being able to communicate via radiotelegraphy.

But THIS sort of thing is what is really

When I re-up it'll be due to the likes of you doing the work you do so well. A pat on the back is well deserved. And noted, as a definite valuable plus to continued membership. Right now I'm leaning in that direction. I got a renewal notice in the mail today. The three year membership looks to be a bargain what with the increase.

Now for a small proposal. Send me one of your "scratch and dent" Handbooks and I'll use it to formulate at least 10 new questions, following the format of those you posted the other day, to submit for consideration by the QPC. Also, I will send to you, by return mail, a copy of Robert L. Shrader's book
"Electronic Communication", fourth edition, for disposal as you see fit. It's not new but is in very good condition, suitable for a library most anywhere, I think. I ran across and bought a nice copy that I couldn't allow to remain derelict and I already had one.

If I find it not too time consuming I just might do more than ten questions.

I have to wonder how much all of the complaints about the disability-code-waiver system and the abuses played in the FCC's decision. I am sure they saw the ARS as an administrative pain in the butt at at that point. Even our friend Riley Hollingsworth is trying to give us a message about the effect of what he terms "petty squabbles."

IMHO, we should concentrate on the important issues. In my personal experience, the FCC is willing to devote considerable time and thought to what it believes to be legitimate and important issues. The unimportant ones can be round filed or swept away with one sweep of the rulemaking broom.

Then you are concerned about his code speed. 0 is as real a number as 5.

If you ARE concerned about people having a code speed, you would be concerned about the large number of hams who pass their code tests and never use the code. Those who do not operate are also at 0 wpm.

>place. Lame plan. The stuff is likely to be any and anywhere.

When I went to Phoenix a few months ago for a convention, I also did some field testing on VDSL. I brought a small 80 M loop antenna with me, to do some DFing. While there, I also heard a few of the PX-421 wireless modem jacks. They were literally audible in my /M setup for a couple of miles on the mobile whip. I tracked down one source in about 30 minutes of driving around, holding the loopstick out the window. It was really dramatic being able to drive past the house where it was installed and see the null. Phoenix was ideal for that, however, with underground wiring. If the overhead wires were radiating, I never would have gotten a null.

That is all bad enough. What about the aggregate of many, many devices being heard at once. One alone is not harmful interference, but put 'em all together. Those NTIA studies show just that on 2.4 GHz. A couple of hams on the west coast have done the same.

>>It is a process of teamwork and cooperation, because under the
>> present rules, that is about the best tool we have available.

> Yeah I know, but you weren't tagged the "point man" without reason.

Actually, my RFI work at HQ has just sorta' grown up on its own. I do what is right for ham radio in a number of areas and they let me. It beats letting my boss think up things for me to do. :-)

>>Even I have heard the whirl of the 'copter blades from time to time.

> See, those loud choppy noises do some good after all!

No, had I acted on my suspicion that the BBEI (Big Bux of Evil Industry) would never do the right thing, the outcome would not have been so good. There are times to be adversarial, but trying the cooperative approach first is much faster, and if you have to get adversarial, being able to demonstrate that you tried to be cooperative first is a plus.

>>I'm sure there are other similar but less sensational, such as CCCR's.
>>When you gonna go to work with the same effectiveness on that one?

I personally won't be doing that. I have quite enough bit off already, and as I all too well know, if one takes on more than one can handle, the end result suffers.

>> In some cases, the right Part 15 sharing
>> partner can be an asset.

> Goood analysis, should be read by every ham.

One of the things I hope to have more time for is to develop more info packages for the ARRL Web page and maybe a few articles. Hams need to understand better what it took me a long time to understand -- in today's world, spectrum is shared. It is NOT our 420-MHz band, we are one of several sharing partners, including the military and radar (primary to use) and Part 15, (secondary to us). On 2.4 GHz, we are primary to Part 15 and secondary to Industrial, Scientific and Medical. The trick is finding compatibile sharing partners and choosing compatibile operating modes with the other signals on the band.

> My disappointment is not so much with either the ARRL nor FCC, but with
>hams who won't recognize the obvious - that there is a communications
>advantage in every ham being able to communicate via radiotelegraphy.

Yes, there is some ignorance about OOK CW, Dick, in both directions. Some hams do believe that it is the most effective mode in the Universe. It is not; some of the digital modes will blow it away. Others pooh pooh the mode and don't see that, of the modes commonly available to hams, it is the most effective under most noisy conditions.

Sure, there is a communications advantage of having every ham able to communicate with Morse code. But it ain't gonna' happen, and it has not been so since I was first licensed. If the regulatory goal was to have every ham able to communicate with Morse, then the FCC rules would require that every ham maintain Morse code transmitting and receiving equipment. You filed extensive comments with the FCC, did you not? Did those comments ask that every ham maintain Morse code equipment? Probably not.

The reason that I believe to behind most desire to maintain the code test is that some hams who do not believe in the usefulness of the mode as much as I do feel that without forcing people to learn the code, the mode will fade away. I disagree.

The bottom line, Dick, is, IMHO, Morse code testing will almost certainly be removed from the Amateur Radio Service, as a minimum in its present form. That means that the ONLY tools you and I will have to promote its use will be to educate hams about its merits and to encourage them to try it. That job will have been seriously undermined later by the way Morse code is being presented now, as a soul-hardening task to be undertaken to keep the evil one out of ham radio.

> When I re-up it'll be due to the likes of you doing the work you do so
>well. A pat on the back is well deserved.
No pat necessary, Dick; it was my job. I am proud to do it, and I try to do it well, but the only reason it is happening is because 165,000 people chipped in.

> The three year membership looks to be a bargain what with the increase.

$31 a year for the non-senior dues, vs $39 a year after they go up. I figure I will hang with ARRL at least 3 years, so I ponied up the $93.

Well-known provision of law in the US - One has no standing to
file unless and until one is injured somehow by that law.
Federal law requires an actual "case or controversy". "Bystander
gotchas" don't count.

>The matter more or less before the Commission is complaint against the

>regulation. An attack against the petitioner is irrelevant.

Attacking the standing of the petitioner is _de rigeur_ in such
cat fights.

One more example of being a wannabe and missing the gut-level
recognition of the above principles of litigation.

Probably because they don't see any value in knowing how to use CW on
the air, I'd imagine. But so far they don't keep insisting it's a
Federal civil rights case, at least on rrap.

Yeah, but he's concerned with the nonsense frequencies on SSB. As N2EY
points out, you don't hear that stuff on CW.

Which really means it is vital that FCC and ARRL be in direct constant
communication so that there is no doubt about what is important and what
is not. I'm not sure that has been happening effectively and reliably in
the past few years.

The value in knowing how to use CW on the air is obvious to everyone.
The value of the Morse code requirement is not obvious to everyone.
We don't need laws designed to protect us from ourselves.

The value in wearing a motorcycle helmet is obvious to everyone.
The value of a helmet requirement is so non-obvious that many
states, including Texas and Arizona, have dropped the requirement.
We don't need laws designed to protect us from ourselves.

The ARRL says they're trying to protect spectrum, true, but their own dumbed-down licensing & limp-wristed policy proposals will make it more and more difficult for them to do so, because how can they successfully defend amateur spectrum when its users are increasingly becoming as dumb as a post and as useless as CB'ers? Soon, there won't be anything good left to defend. What words can the ARRL use to convince the FCC or Congress that the spectrum is best left to poor operators with bad operating habits? The scenario is akin to a FLY defending a Dung-Heap (ARRL being the fly), they're trying to defend a service that progressively gets stinkier with every new policy they propose. If the ARRL wants to defend amateur radio, let them propose improving licensing standards. The high merits, integrity, and abilities of spectrum users is what will protect the spectrum best and will provide a pool of quality radio operators for service to the country when needed. Real Value!
I'd still be a league member today, maybe even a life member, but the ARRL screwed up when it went against it's long held principles and the founding purposes amateur radio was built on.

Mostly the early amateurs that "amateur radio was built on" were a
bunch of unruly rascals who roamed the spectrum at will, interfering
with commercial and military stations alike, and had to be rounded up
and corralled at "200 meters and below". Far worse than today's CB
crowd by a long shot!

So...what are you actually saying there? Seems to me it is a nice
bit of wording that says "shut the hell up because you don't count
unless you've done the same thing as I did." Or are you saying
that it is somehow "improper" to petition our government unless
one is "injured?"

Seems to me that there is a rather actual CONTROVERSY going
on in regards to one small regulation by a government agency.
Are you saying that there is "no controversy" just because you
don't believe there is one?!? Or are you just saying the above
to try and make some kind of case for a demand to shut up?

>>The matter more or less before the Commission is complaint against the

Interesting resort to a French phrase which means something
like "SOP." :-)

I suppose such pseudo-sophisticated statements are necessary
when some cats get scratched...and the result is a carefully
worded version of "#$%&!!!, do it like I had to do it...!"

> One more example of being a wannabe and missing the gut-level
> recognition of the above principles of litigation.

Oh, my, what next? Quotations of Case Law in the USA? :-)

What is your take on the FCC's own statements (in 1990 and in
1999 Reports and Orders) that it does not feel that a separate

morse code test does not meet their requirements in determining whether or not an examinee can be considered suitable for an amateur radio license?

Would you stuff the FCC's own statements into the "wannabe" and "gut-level recognition" pile? Or will you acknowledge that the FCC is currently the regulator of US civil radio regardless of the current administration and your views of the political leanings of the about-to-be new Commission Chief?

...the reply has all the bunting and flags of "when I was younger we did things the 'right' way" attitude. :-)

Well, maybe if they can get their girlfriend to fill out a job application for them, and go drug-free long enough to pass a urinalysis, they might get a janitorial or security job at the new power plant. Then they can go to night school and get a GED, so they can apply for better positions, such as pipefitter, instrument tech, etc. Then they can move to Monterrey and commute 2 hours in an SUV...

If he rolls back Brady and the GCA68, we'll be back on the right track.
I also want him to open military artillery ranges the third weekend of
every month for civilian cannon practice.

Of course you know what it means because your CB syntax is perfect. And
it doesn't appear to violate a single FCC regulation while getting the
meaning across perfectly. It's the kind of stuff I do on the air just
to aggravate the Radio Policeï¿½.

The Constitutional argument is lame?

Which are the strong arguments?

> There's not going to be another revolution, and it sounds
> really lame to talk about needing to be prepared in case of one.

We've lived a generation not being allowed to own offensive weapons.
Within this generation, we will not be allowed defensive weapons. By
the third generation, even "sporting" weapons will be gone.

The liberals will round up all the mounted deer antlers and send them to
China to make afro-deesiacs under some favored nation treaty.

Seem's like the ARRL can't win, doesn't it. When folks were screaming to have the code requirement reduced or removed, the League was seen as a bunch of old fogies who wanted nothing better than to keep out anyone unable to copy code. Now that the licensing structure appears to have favored the no-code crowd, the opposition thinks the League is at fault.

If you want to change the League, join and vote. If you are not a member, quit complaining. The only reason I'm not a life member is the cost. I should have become a life member as soon as I was licensed in 1977. It would have paid for itself several times now.

Join the League or not. But the issue of licensing and code requirements are not decisions they make. The ARRL is the most vocal representation we, as amateurs and others, have with respect to hobby radio. If not for the League, only commercial interests would be heard by the FCC.

My opinion. I apologize to the newsgroup for wasting space where I would rather read posts swapping gear.

> What the HW-7 lacks, however, is any specific frequency
> stability/readout. In using the HW-7 you must hope
> someone happens to just be tuning across the frequency
> you are transmitting.

You raise several good points. Frequency agility has the advantage of being able to break into a QSO in progress. The Hw-7 used to be worthwhile for ragchew if you had a xtal in the Novice band, because it was so full of signals all the time, and lots of people would tune around after making a call. It's not happening much anymore because there are fewer Novices, and there are fewer people who have had the inclination to learn efficient operating techniques anymore. These are some of the things "not stated". Your questions reveal that (like many today) you weren't required to develop certain skills that are better developed with HF CW QRP operations. So sadly, you don't know what I'm talking about. I can only blame this on the licensing structure, because even though 97.1 is well stated, the license structure just isn't supporting it anymore.
http://www.arrl.org/FandES/field/regulations/news/part97/

Another idea (probably stated more fully in the 87.400's) is that there are no specific assigned emergency frequencies in ham radio, because they are ALL Emergency frequencies. The idea, was that ALL hams be able to support emergency communications and that ANYONE be able to perform them. The 2-meter mobile is a great asset, but on longer trips, you may find large stretches of no coverage, or repeaters where all the regulars are either on the road themselves or just busy elsewhere. In addition to developing an emergency comm's monitoring system on a local wide area machine, you should also look into ARRL operating aids and publications (even older ones devoted to Novice training) and get involved with CW NTS nets and MARS (you don't have to do it all at once, but each are good experiences).

>
> Actually, you could include a solar panel and/or a hand generator
> to power it.

The solar panel would be far too fragile, but the hand generator idea has promise. There is a Short-Wave receiver on the market, that has a clock spring generator, that can power the radio for 30 minutes after being wound up. Neat!

In its comments to the FCC wrt restructuring, the ARRL you espouse so strongly asked the FCC to increase the technical content of the written exams to offset any changes in Morse-code testing.

> The high merits, integrity, and abilities of spectrum users is
> what will protect the spectrum best and will provide a pool of quality

The ARRL has been steadily improving its Tech Info pages on the Web, has changed QST to offer material to help the newcomer learn the ropes, has started an Educational and Certification program, all intended to help hams be better hams and better fulfill the goals of the Service.

>that it is somehow "improper" to petition our government unless
>one is "injured?"

One has standing to file suit in Federal proceedings when
one is affected somehow by the statute or reg or action of the
agency. To use your inaccurate phrasing, when one is injured
or can be injured.

If passing the test is the only barrier to getting the
license, you have standing to protest things about the test -
you are "affected". If you are not eligible to get the
license even if you pass the test, (a representative of a
foreign country, for instance) you do not have standing
to protest the test but do have standing to protest the bar
that affects you.

>Seems to me that there is a rather actual CONTROVERSY going

The trial court judge determines if there is a true "case or
controversy". Smart lawyers make sure that one exists before
filing Federal proceedings.

>>>The matter more or less before the Commission is complaint against the
>>>political, legal and constitutional validity of a the Morse code exam
>>>regulation. An attack against the petitioner is irrelevant.
>>
>> Attacking the standing of the petitioner is _de rigeur_ in such

>
>Interesting resort to a French phrase which means something
>like "SOP." :-)

Right on, brother. I once was the recipient of such an attack
by an opposing attorney because I disclosed in a petition
against his client that I was a former FCC employee, even
though the law required me to make such a disclosure in that
proceeding. SOP indeed.

"If the facts are against you, pound on the law. If the law is
against you, pound on the facts. If both are against you,
pound on the opponent. If everything is against you, pound on
the table."

>What is your take on the FCC's own statements (in 1990 and in
>1999 Reports and Orders) that it does not feel that a separate
>morse code test does not meet their requirements in determining

>amateur radio license?

IOW - they feel that a separate Morse test meets their
reuirements ... they're the ones who set the rules...whether
they are accurate or not.

My personal feelings - do away with the Morse TEST. I've been
public with that for years.

>Would you stuff the FCC's own statements into the "wannabe"
>and "gut-level recognition" pile? Or will you acknowledge that
>the FCC is currently the regulator of US civil radio regardless of
>the current administration and your views of the political leanings

What planet did you just arrive from, Len?

Ever since the reign of Madman Mark (Fowler) I've had no
problem separating the agency and its function (which I
respect) from the Five Tubeless Tyres who sit on the Eighth
Floor and flail around in their attempts to steer the agency
(whom I may not respect).

To quote my erstwhile teacher, Mr. Justice Marshall:
"What do you mean that folks may not like you? President
Eisenhower is President of the United States and half the
people in the country don't like HIM..." <ggg>

I agree that the public is being given more access to masws
communication...
BUT
the large telecommunicators have again stopped the low power FM
community stations from operating legally and we are seeing the mergers
of media giants including newspapers, radio and TV that were once
deemed monopolistic...
as for HAM RADIO: -- Hams are but a minor subclass of the public.
They are those hobbiests who have followed FCC regulations and applied
to take ham exams...They are not "the public" at large. IMHO they
should remain protected...That is - the frequency allocations should
remaion protected...
BUT
Politically if they want to remain protected they must prove their
worth to the USA, over and above the public. An amateur Radio Operator
is no longer an apprentice commercial radio operator. Modern
technology has made the commercial FCC Radio Operator obsolete and thus
the Ham who is a commercial radio operator in waiting is also obsolete.
The only way to bridge that obsolecence is to bring up the Hams and
their licensing exams to the standards of modern communication
technology. The ARRL could be a driving force to do so...but
apparently it is not at the present time interested in strengthining
the basis and purpose of the hobby....The ARRL at present is expecting
a future decrease in membership and is thus trying to increase its
revenue by raising its dues...

Ed...I have news for you...You can't sell stale bananas by raising
their price. Enuf sed.

The ARRL is not interested in doing it exactly the way you say it should, so in your mind, it is not doing it at all.

It is too bad; the things you are choosing to say to tear down amateur radio to be "right" are undermining the very principles you stand for.

>> What is NVIS?

>Near Vertical Incidence Skywave

To add a bit to that, it is a term applied to the energy from an antenna that is radiated nearly vertically upward from the antenna. At lower frequencies (perhaps up to about 10 MHz or so, under some circumstances), it is returned to earth by the ionosphere, relatively close to the transmitting station. It is most useful on 3.5 MHz, and sometimes on 7 MHz, for communications out to about 100 miles or so.

A vertical antenna radiates very little NVIS, so it is not as good a "local F hop" antenna as is a low horizontal dipole.

You are incorrect in assuming my initial comments
were about a "civil rights issue", if you read carefully you
will realize that I was saying a "due process".

But, it now appears that the Morse code exam
requirement is not in conformity with law.
5 USC 706(2)(a). The FCC stated that the only reason
to retain the 5wpm exam was ITU rule S25.5.

No sense fight about "civil rights" or "due process"
when 5 USC 706 will due the job.

Prior to April 15, 2000, a person who took a 13 or 20 wpm code and
fails it, was adversely effected by 47 CFR 97.503(a)(2)&(3);
therefore, had standing.

> >The matter more or less before the Commission is complaint against the

>
> One more example of being a wannabe and missing the gut-level
> recognition of the above principles of litigation.

So far, no one need to prove standing. Indeed the FCC took action on their
own intitiative, to wit:

The 13 and 20 word per minute telegraphy examination was removed as a
requirement in 1999. The FCC stated in its Report and Order (FCC 99-142)
for WT Docket #98-143 that:
(a) "the public interest will best be served by reducing the telegraphy
examination requirement to the minimum requirement that we have found that
meets the Radio Regulations" ;
(b) "an individual's ability to demonstrate increased Morse code proficiency
is not necessarily indicative of that individual's ability to contribute to
the advancement of the radio art" ;
(c) "such a license qualification rule [Morse code exam] is not in
furtherance of the purpose of the amateur service and we do not believe that
it continues to serve a regulatory purpose" ;
(d) "the amateur service is fundamentally a technical service, the emphasis
on Morse code proficiency as a licensing requirement does not comport with
the basis and purpose of the service" ;

(e) "reducing the emphasis on telegraphy proficiency as a licensing requirement will allow the amateur service to, as it has in the past, attract technically inclined persons, particularly the youth of our country, and encourage them to learn and to prepare themselves in the areas where the United States needs expertise" ; and
(f) "telegraphy proficiency is not a significant factor in determining an individual's ability to provide or be prepared to provide emergency communications" .

After the Commission put that ink on the parchment, how hard to do think they wil
fight the keep ITU rule S25.5 afloat.

Exactly. If by this point in history hams had found any particular real-world advantage to using spectrum analyzers for on-the-air ops the things would be in all over the catalogs. They ain't and sure as hell that settles that. Writing off spectrum analyzers as useful communications tools has to do with seasoned radio operators being able to separate the wheat from the chaff, ya know what I mean Len?

Ah, very short skip. Should have said VSS :-). I've noticed it lately
on 40 meters around noon. A regular in my group about 10 miles away
who usually runs S5 (on groundwave) has been booming in here at +20
over with QSB...

>A vertical antenna radiates very little NVIS, so it is not as good a "local F
>hop" antenna as is a low horizontal dipole.

Brian asked if a mobile antenna being a vertical would be good for
NVIS. I think he was commenting that perhaps mobile HF might not be as
good for *local* emergency communications. I would agree HF might not
be the best choice for local personal emergencies. A cell phone likely
would be. However to answer the question Brian, you don't really need
to rely on NVIS for someone close by on HF. You only need someone with
a telephone anywhere in skip-land who can make an emergency long
distance call for you...

Ed, in Rockford, Illinois of the 1950s there were only TWO stores
that sold radio parts suitable for amateur radio equipment. [that's
where I grew up] I was visiting there last September and there
are now at least FOUR such places. Three of those are also
heavy into carrying computer-related stuff...which should not be
a surprise.

Right now, at home in a suburb of Los Angeles, there are at
least THREE stores within a 3-mile driving radius which carry
"ham radio parts," one of them the HRO branch mentioned.
None of what I mentioned are of the "consumer electronics"
chain stores such as Circuit City, Best Buy, or Radio Shack.

Electronics distributors will sell over-the-counter as a general
rule. Out here, there's an Avnet place within 2 miles and an
Allied Electronics within 10 miles (at the other end of the
Valley). Problem is that hardly any distributors or retailers
carry "ham radio parts" as such...it is all electronics parts.

Within 4 miles radius of my home there are three "surplus"
places but the surplus is electronics manufacturer's surplus,
not old WW2 war surplus radio stuff. There might be one in
Pasadena still left (dunno, haven't looked there in years) at
a distance of 6 miles from my house...they carried military
radio stuff back in '71. :-)

I flipped through my Rolodex for electronics parts vendors
in my locality and there are over NINETY of them (probably
130 total but I quit counting those that also carried computer
goodies)...and none of them are the consumer electronics
chain stores or computer things only type places. Only
three have walk-in-and browse ham stuff and one of those
is another HRO way down in Anaheim over 40 miles away.

In this urban area at least, there is NO dearth of radio parts vendors. That demise of "ham radio stores" may exist in other localities...I have no dispute on that...but few seem to realize that consumer electronics and non-ham electronics hobbyists have grown together in both numbers and variety.

>being wound up. Neat!

The "wind-up" receiver has been around for at least three years,
first mass marketed by a South African company which designed
it. My neighbor has an AM-FM broadcast one that includes a
"fragile" solar cell array. Several pocket calculators have a
"fragile" solar cell array.

The US Army had the 10 to 15 Watt RF output AN/GRC-9 in WW2,
manpack by two men, one carrying the arm-powered generator with
its funny tripod-seat arrangement. Trust me, after a half hour of
continuous winding (peak load on transmit was 40 W max.), the
"winder" was QRT and needed replacing.

All of this is rather old hat and been done before. If anyone is trying
to seriously cruise for new ideas on "emergency power," doubtful
IMHO, then they should investigate leg power. Leg musculature
has more mass and can be conditioned by exercise off of a bike-
mount-like generator adaptation. This leaves the arms and hands
free to control an Rx-Tx.

Very few vertical antennas radiate "end fire" Ed. :-)

Look at US Army and USMC humvees equipped with HF-VHF
radios and long whips. Those are already tied back at a slant
courtesy of an extra little cord and clip. The radiation blob is
now upwards a lot more. Army has been doing that for years.

NVIS technique is standard doctrine in military field radio.

> Do you think that Len believes that what he says is untrue?

Of course he doesn't, Ed. And some people still think the world
is flat and the moon is made of cheese, too.

For the record, a "lie" need not simply be "No, I did not cut down
that cherry tree..." would be a direct lie.

However making statements that are deliberately misleading,
untruthful, or decietful is also lying.

Lennie's frequent assertions of conspiracy, deception or attempts
to manipulate ham radio for some ulterior motive are certainly lies.

The facts are there for all to see, and the ARRL certainly makes
every effort to keep it's program well above board. I consider
Lennie's assertions of impropriety by the League, it's board members or
membership in general to somehow undermine Ham Radio to be a blatant,
bitter lie.

In a minor change of subject, I have been trying to wean this
thread, yet you and Hans keep seeming to perpetuate it. Things slow
these days?

As with government, if you don't participate, shut your mouth and go along with what the participants are doing.

If you don't like the policies and practices of the incumbents, then get off your duff and become one of the leadership so you can put forth your ideas for better ham radio.

We'll be sure to drop them a line and let them know you have
granted your approval.

Of course, I think it's been stated to you on occassions too
numerous to count that the ARRL is representitive of it's membership.
no the other way around.

It would be inappropriate for the BoD of an organization that
espouses democratic principles to tell it's members what it's policies
are.

In fact, the ARRL must represent the views of the membership.

Just as it did with the NCT in 1990, the League, once solidly "pro-
code", "changed" it's policies on same when it was apparent that the
generally held opinion of the membership was no longer the one
PREVIOUSLY held.

I fail to see the controversy in that posturing. It's what's
SUPPOSED to happen.

I was getting there. Using a whip tilt adapter would allow NVIS with an
80/75 and 40M whip. Once the ARRL releases that 5mhz band to the rest
of us, it can be added to the NVIS arsenal.

> A cell phone likely

Yablo Hayspanyol? Guess what happens when they dial 911 for you? Or if
they don't have your local phone book. SW Bell might not give directory
assistance to an Ameritech customer.

Back when I cared a lot about emergency comms, I would carry last years
phone book in my vehicle. I also had a hazmat ID book, repeater
directory, state and county roadmaps, ...

Yup, Doctrine! Everyone thinks it's to pass under low overhangs.

But there's such a DX following in amateur radio that these antennas get
cutesy labels such as "cloud warmers" and dummy loads and such.

>3-10 years to do so. So your problem is whether to study or moo.

Actually, that code may very well be legal on HF. I see no reason that a "digital" signal could not be OOK CW, which is a legal modulation on HF. The other requirement is that a digital code sent must be publically documented. I would have to check with a few legal types, but I bet this would meet the requirements, under the same provisions that allow PSK-31, AMTOR, and a number of others.

Correct.

>So far, no one need to prove standing.

Depends on the proceeding. I'm sensitive to "standing" - I
represented a (commercial) frequency coordination group in a
fight against a specific Commission license grant in opposition
to the coordinator's recommendation and was shot down by the
grantee (and ultimately by the Commission) on the basis that my
client did not have standing - we interpreted various Public
Notices as granting us standing but "the fix was in" and the
Bureau backed down. We won in the end, though -the business
was sold and the new owners cancelled the license.

As I explained in an earlier posting, one of the obligations
in Federal civil litigation is for the petitioner to show that
that court has jurisdiction and that the petitioner has
standing to bring the suit.

Indeed the FCC took action on their own intitiative, to wit:

The FCC can ALWAYS do so in accordance with their Congressional
mandate to regulate the use of the spectrum. You will see
this indicated in documents as "action _sua sponte_" or"action
on [its/our] own motion".

>After the Commission put that ink on the parchment, how hard to do think
>they will fight the keep ITU rule S25.5 afloat.

They couldn't care less, but "Inertia is a Terrible Thing".

I don't think that Hiram P. Maxim would agree that they were an "unruly bunch".
Every radio signal within range interfered with every other radio signal in those days of very wideband spark transmitters, very low noisy frequencies and characteristically poor receive sensitivity, particularly in many if not most homebrew ham recievers. Certainly the QRM sure wasn't intentional, just an artifact of the technology and lack of regulation of the day. As today, hams often transmitted without realizing that the frequency might have been busy,since they often could hear only one side of the contact and that when that side was recieving the frequency would be quiet.
The chaos on radio in those early days can't be laid to the "unruly hams". It was a part of the evolution of radio communication that hams had started.
Marconi always considered himself a ham although he never held a ham radio license.

I dunno. QFU isn't on my Q-signal list. I've never heard it on the air.
Maybe he's coining a new one. Maybe that's another urban legend.

All of which makes me axe the musical question -- What does increasing
the technical content of the written exams have to do with testing to
ensure proficiency in a practical, manual communications skill? The
two concepts are not mutually exclusive. So why, then, are supposedly
intelligent and presumably educated people implying that they are?

>Ed Hare, W1RFI

Ed:

I agree, which is why I now advocate the code tests being dropped altogether. Five WPM isn't fast enough to approach the proficiency which would give a code learner the confidence to try out his skills on-the-air. I never transmitted so much as a "dit" before I passed my 5 WPM test; nobody did, actually. However, it was months of regular on-the-air practice which got me from 5 WPM to 20 WPM -- and that would not have happened without the fun and excitement of my on-the-air experience. And, the better I got at CW, the less thrilled I became at 'phone. I was originally licensed in '81, and by '87, I was pretty much finished with HF 'phone. A particularly henious experience on 10-meters in '91 put the final nail in that coffin! Unfortunately, with a 5 WPM maximum code testing speed, the Morse code learning process starts and stops at the same time. Therefore, what good is the test anymore? The only problem now is to figure out how to retain CW spectrum -- which, in the absence of relevant testing, is going to be a neat trick!

>Or if they don't have your local phone book.

If you travel only in your local area, I don't suggest HF for personal emergencies. Cell phones are the best. However if you're traveling cross country, *by any route*, you can't beat HF for continuous coverage...

Probably the most likely personal emergency need for me would be if I had a vehicle breakdown 50 miles from the nearest town. I have a 1-800 number to call for that, which would be easy to relay on HF if the cell phone was dead. In a real emergency like a serious illness or accident, I would just have the HF ham contact his local authorities and give them the information. They would then make the appropriate calls...

You did hold it to one. This is a variation on a code used by POWs in the
Civil War that supposedly was never cracked. To make it writable, it used
two # and two X. In tap form, it used 4 bits to indicate the box and 9
for position.

I think (or methinks if you like) the key phrase is 'easier to learn' than
Morse. Perhaps my feelers are set a bit tight but escaping a code test
sure seemed to be the object of the game.
Personally, I am getting tired of the whole verstunken debate; providing a
path for the 5wpm contingent to get to journeyman levels is far more
important to the hobby than defending the medium from bleating cattle.

Ed..I'm sorry if you think that my intention is to "tear down" ham radio. I don't want to do that. I just want to make you aware of the present sociology, technology and economics that may result in the "tear down" of ham radio...at least ham radio as most of us would like to see it. Many hams recognize the same problems that I see and are disgusted by the way things are going. I'm not a goody-good. As an engineer and as a teacher I often get people disgusted when I present facts that seem pessimistic...BUT somebody has to tell them that the Emperor is nude. I take such tasks on myself and don't mind being at risk for it.

The fact that ham radio (as most of us know it and want it to survive) is becoming obsolete has been a subject even among the most avid hams. Some have been disgusted since 1951 when the original technician licenses were issued. The idea of ham radio without short wave (HF) was considered a new dimention that polarized the HF hams from the VHF and above ones. Now we are entering a new era. Morse code as a ham requirement is being deemphisized worldwide. Will that get more Technicians to eventually work the HF bands? Perhaps it will. Perhaps some Techs see the hobby as two meter repeater clunking and that is their only bag. The modes and the frequencies that individual hams want to use should not divide them socially...
BUT
Now there are other communicators who can use cell phones and the Internet for fun and games as well as for business and household applications. Lots of hams also use cell-phones and the Internet.

DXers are sending QSLs via e-mail and there is a lot of relaying between the medias. This might not mean much to each ham involved but there is certainly going to be a metamorphasis of hams leaving the ham bands for more practical communicating methods which might better fit their needs and take up their valuable time. Can old timer hams truthfully recommend ham radio to youngsters? I would like to do so myself...BUT everytime I try to sell our hobby to an inteligent young potential techie, I find it more impossible.

It has always been my opinion that ham radio can be saved...not just as it is now but as a valuable technical educational asset. To do so ham radio leaders must rethink the hobby. Like an old computer, the hobby needs a lot of up-grading if it is to remain competative. The basis of the hobby must be organized so as to give it NEW purpose. If it sticks to present modes and methods it can not be accepted as an modern emergency asset, nor as an intermittent messanger of international good-will. It is obsolete when comparede to unlicensed communication as well as to the organization of commercial witrless services and the World Wide Web. If the ham licenses are to be given away without real incentives they can hold no value and their holders can thus hold no proof of being a national or international asset.

Once upon a time there were two ham handbooks. "The Radio Amateur's Handbook" was an ARRL publication. "The Radio Handbook" was a publication of the Editors and Engineers. "The Radio Handbook" was labeled: - "The Standard of the Field - for advanced amateurs, practical radiomen, practical engineers, practical technicians". The ARRL was in the north east, but the Editor's and Engineers were westerners and had a somewhat different slant on what ham technology was about. The editor of the latter has very recently passed away. He was Bill Orr, W6SAI. First Lew McCoy...Now Bill Orr...Maybe their passing is a sign of the end of the golden era of ham radio; The time when senior hams were respected for their technical abilities. Bill worked for Eimac and was in tune with the rapidly developing electronic industries of California and the other western states...not just New England, New York and New Jersey. I mention this because even though Ham Radio is National and International, it draws on the progress of hams in different environments, who apply technologies at different rates and have different foresight. If ham radio stops attracting such innovators as McCoy and Orr it will not progress in the coming century. Large corporations will not research and develop any innovative equipment for the dwindling ham population...even some of the Japanese corporations may drop out of the picture. If a new mode of modulation was developed, could it be given FCC approval and widely accepted among hams as single-sideband was in the 50s? There is no Art Collins and his crew at Cedar Rapids, no Collins Radio (It was bought by Rockwell International).

Even if there are capable ham experimenters, can they afford to revolutionize the hobby and bring it up to modern standards? How many world class electrical engineers are now willing to devote most of

their working efforts to ham radio? I dunno for sure, but the present trends all seem in the wrong direction and ill conceived.

Hams need more incentives, more license classes, more ham exams...and more respect.

My my, you take a business trip to London for a few days and
return to find major upheaval in the policy department.
Well done ARRL! I disagree with the possibile retention
of a code test for USA, but that's far enough out that I am
quite happy with the change regarding S25.5.

As to my "Sohl" proposal ala QST some years back...I'd not
oppose having some questions along the lines of those
similar to the questions regarding knowledge of the phonetic alphabet.
(e.g. The morse code characters for SOS is: dididit dahdahdah dididit
with other answers being incorrect versions).

>As a code guy, I think it is important that the applicant be exposed to the
>code from the getgo and that he or she be given as much opportunity to learn it

Actually, Dick, rec.radio.cb was added to this thread by Stewart R Teaze, the person who started this thread. And, I'm sure he added rec.radio.cb because CB'ers are members of the radio community and therefore might have some interest in a discussion about a proposed new radio service.

Of course, since then, it has become very obvious that some CB'ers don't want to be considered part of the radio community, and are therefore not interested in discussions about that. So, I'm sure Stewart R Teaze will take that into consideration before adding that newsgroup to future discussions.

Somebody recently reported that such a case had been presented
to the courts and the ADA won. I certainly don't see any benefit
at all for a deaf person having to learn Morse code unless he/she
simply wants the gigantic challenge of reading Morse code while
looking at an LED or feeling of a speaker in the normally noisy HF
environment.

Yes. And so I have stated on numerous occasions,though that fact seems
tohave been overlooked in their zeal to overpower it still, even though
it has already been killed. The code test in toto is as dead as the
molasses of officialdom will allow it to be, tho it won't totally
disappear for an unknown number of years hence due to that very effect.
And with the ingenuity of those whose whole intent seems bent on
avoiding learning Morse at all costs, even to the poinbt of advocating
the "tap code" as it's replacement, the idea of persuading many of them
to voluntarily become skilled to useful Morse speeds doesn't seem to
hold much realistic promise.

> > The California power crisis is not due to what we have been led to
> > believe. Instead, it is the fault of the internet.

Like a lot of people, I kind of blew this bit of opinion off.
Deregulation was handled so poorly in CA that a collapse was inevitable.
Nothing new has changed that situation. But the suddenness and ferocity
of the collapse may have indeed been influenced by the New Economy.

1990 1996 1997 2000

Demand GW-H 240k 258k 250k 300k
Capacity (gigawatts) 55 56 53.6 53.8

Capacity excludes out-of-state and micropower.

What the hell happened? The only thing I know for sure is that Silicon
Valley's consumption has grown at over 8% per year. The man has a point
albeit a fairly small one.

The 'deregulation that wasn't' is adequately summarized in the Economist:
"...California reforms are a ragbag of muddled half-measures and downright
anti-competitive clauses".

But the man who predicted this whether deregulated or not would have to
have a big red S on his sweatshirt.

How would you feel about the test containing 5 minutes of Morse code at 5 wpm,
and a reasonable number of questions about its content?

>Again, kudos to ARRL...and thankfully I renewed for 3 years
>a few months ago before the now approved dues increase :-)

I did it after they announced the dues increase, but it is not too late; the
increase goes into effect in July. Every time the League raises dues, there is
an increase in multi-year renewals. I don't even mind paying the increase, but
I would rather make a contribution to something specific of interest to me,
like the Big Project or the ARRL Lab Test Equipment fund. :-)

The rationale, if memory serves, is that the ARRL wanted to see the overall level of difficulty and accomplishment remain the same.

IMHO, the relationship is indirect, at best. OTOH, I believe that testing for an understanding of the technical fundamentals is more valuable to the Amateur Radio Service than is testing about Morse code decoding proficiency.

> So why, then, are supposedly intelligent and presumably educated people
> implying that they are?

You tell me, Larry; I am sure if I did a deja search I would find you stating that Morse code testing is required because the written exams are "easily" memorized, or otherwise inadequate.

>Morse. Perhaps my feelers are set a bit tight but escaping a code test
>sure seemed to be the object of the game.

If that is the object of the game, the game has been lost. If legal, it can be used on VHF by those who have not passed a code test (so can Morse code), but to use a digital mode on HF, under the present rules, one would require a Technician license and the HF endorsement granted by passing a 5 wpm test.

> providing a path for the 5wpm contingent to get to journeyman levels is
> far more important to the hobby than defending the medium from
> bleating cattle.

If those of us who enjoy Morse code want to see newcomers use and enjoy the mode, too, you are quite right -- ways of getting people from 5 wpm to higher speeds are pretty important.

I am NOT impressed with the methods being used. To the contrary, I believe that the anger, the bitterness and the name calling that is being done by some to "defend" the mode is setting the stage for failure. Telling newcomers that Morse code is a difficult task that will test their character and help keep the riff-raff out of ham radio will not send a message that this is something they can use and enjoy. A message that explains why it is enjoyable, why it is effective and letting them see love of the mode in your eyes and in your words will be much more likely to gain converts that much of what I have seen here.

I think most of us realize that, sooner, or later, the Morse code requirement for testing will either be dropped or significantly changed. If it is, many of those things that are being said right now by people who claim to be Morse code proponents will be more likely to keep people away from the mode than to encourage them to use it. Think for a minute about what you will say to encourage new hams to use code if the code test is no longer part of the the requirements. THOSE words are the ones you should be using right now, to the large number of hams who have not yet passed a code test and to the ones who have passed a code test, but are not yet trying out the mode. I have seen the collective memory of the Amateur Radio Service over incentive licensing. Over a quarter of a century later, the ill will still echoes in our circles. Don't doubt for a minute that this next generation of hams will remember what was said today, whether they have to remember if 3 years hence, or 10.

Those who really want to preserve the use of Morse code on the ham bands should be encouaging new hams to give it a try. They should be forming slow-code nets, and looking for those 5 wpm CQs and giving them a nice QSO and some affirmation that this is a fun mode that will bring value and enjoyment to

their use of it. Where are these things? Has ARRL done them? Has FISTS? Have you? All I see by those who may think they are "defending" Morse code is posturing and name calling. IMHO, taking real steps to get people from 5 wpm to what you term "journeyman" levels is more valuable than the use of the term "bleating cattle" on rrap.

I noted in the ARRL Board minutes that the Board has directed ARRL HQ staff to take steps to promote the use of Morse code on the bands. At this point, I don't know what those steps will be, nor am I sure that ARRL will actually pull this one off, but I sure intend to offer my input to what may be needed to make that happen. Although at this time, I have a very short list of what will help, perhaps the first thing on the list is to drop all the name calling and bring back the fun.

Morse code use on the bands has not been killed at all, Dick. Are you really trying to destroy is just to be "right" in this debate? If so, you are wrong.

> the idea of persuading many of them to voluntarily become skilled to useful
> Morse speeds doesn't seem to hold much realistic promise.

If you really are giving up, perhaps you could stand back and let those with a more positive outlook take over from here. Your choice of words is really trying to hasten the demise of my favorite mode. I disagree with you that Morse code use is unable to stand on its own merits.

The SSB County Hunters and Mobile Emergency net meets daily and continously when the band is open on 14.336 MHz. The CW net meets on 14.0565, but the operation is a bit more sporadic. If I had a mobile emergency, I would break the 336 net and be pretty confident that someone would have good propagation to me and would ensure that I got help.

Ed:

I agree with the above, but there's only one problem -- it is the people who were AGAINST code testing who were making those claims! All of the anger, bitterness, and name calling was started by those who sought to avoid code testing by discrediting those who were in favor of it on the basis that they were being mean-spirited and not being "inclusive" in their attitude toward newcomers to ham radio. The touchy-feely, politically-correct liberals whined, and the League, the equipment manufacturers, and the ham radio publications took up their cause, because they knew on which side their bread was buttered -- or so they thought!

>A message that explains why it is enjoyable, why it is
>effective and letting them see love of the mode in your eyes and in your
>words
>will be much more likely to gain converts that much of what I have seen here.

Which is exactly the message the pro-code test people have been giving all along -- in addition to largely ignored offers to assist people in learning the Morse code. The problem is -- nobody wants to make the required effort. A classic "You can lead a horse to water, but you can't make him drink" scenario. Just what exactly are the Post-Restructuring numbers of newly-licensed hams with a General or Extra ticket?

>I think most of us realize that, sooner, or later, the Morse code requirement

No, Ed, what will keep people away from Morse code is the necessity to learn it and practice it enough to gain operational proficiency. In other words, the same thing that kept people away from it all along.

>Think for a minute about what you will say to
>encourage new hams to use code if the code test is no longer part of the the

>Have you?

Yes, Ed, I have! As usual, participation is practically nil. Everyone who was interested is now "grandfathered" to the Extra-class due to having passed a 5 WPM test years ago; and they're all on HF phone with a vengeance.

>All I see by those who may think they are "defending" Morse code is
>posturing and name calling.

That's funny -- that's exactly what I've seen coming from those who were seeking to reduce/eliminate code testing requirements!

> IMHO, taking real steps to get people from 5 wpm
>to what you term "journeyman" levels is more valuable than the use of the
>term
>"bleating cattle" on rrap.

No, Ed, what would have worked was a willingness of those who wanted HF licensure to make the effort to learn and gain useful proficiency in Morse

code -- as opposed to their incessant, cattle-like bleating about how learning a useful communications skill was inhibiting the development of high-speed digital modes, etc, etc, etc.

>I noted in the ARRL Board minutes that the Board has directed ARRL HQ staff

>bring back the fun.

Ed, I've never done any "name calling" except within the confines of the small, closed society of Usenet. My in-person behavior to prospective ham radio newcomers has never given anyone any cause to reject the notion of learning the Morse code. In every case, once these people found out that learning this skill would require a serious commitment and genuine effort on their part, they disappeared in droves -- only to show up on the VHF/UHF repeaters praying for some "ducting." So, one of the first things you'll have to come up with is some way to overcome the natural laziness of people who just want to get a microphone in their hot little hands and start talking!

The only thing that kept the CW mode alive as long as this was the REQUIREMENT to learn it at levels which lead to operational proficiency. In the absence of that requirement, the mode WILL die. And no amount of blowing sunshine up people's asses will change that. The problem is called LAZINESS. That's what you're up against. Good luck.

Ed:

I'll betcha a lobster dinner you can't! I've never said that there was any direct relationship between code testing and written exams. I've *always* said that the two were separate and equally important tests, and that I supported the updating of the written exams, including a change from the short-term memorization paradigm now so common today. However, I've also said that the written exams were appropriate for an *amateur* radio license examination (emphasis on the word *amateur* is important). If you can find a quote from me where I clearly state that the written tests were directly related to, and could serve as a replacement for the code tests, you've won a second lobster dinner from me!

> have a big red S on his sweatshirt.

Nope, I predicted it over 20 years ago, in a column regarding the
anti-powerplant folks and their move into the California Legislature.

You can't get electricity from a generator which wasn't built. More
people means more need. Economic expansion means more people AND more
commercial power use, but the Neanderthals in Sacramento made it all but
impossible to build capacity to follow the increase in need.

Your computer has about the same current drain as the one you had 10
years ago -- the rough equivalent of running your living room lights --
AND today's computers are "energy aware," dropping consumption during
periods of non-use. While there are a few more computers today than a
decade ago (most systems sold are replacing existing hardware, and the
older machines are not being re-used), there are not enough to cause a
major shift in consumption patterns.

The answer can be summed up in two words: Code Quick!

The web site is:
http://www.cq2k.net/

Too bad there hasn't been a review of Code Quick in QST. It's also too bad that Code Quick isn't better well known or better well promoted.

Code Quick may be silly, cutesy, and over-the-top, but it WORKS!!! I challenge you to find anyone who will say, "I really, really tried, but Code Quick didn't work." (That's right, none of the Code Quick critics actually used it.) Then compare the failure rate of Code Quick to the failure rates of the more conventional methods (Koch method, listening to Code tapes, memorizing dits and dahs, listening to Morse Code and expecting divine inspiration to take over, etc.).

If you don't believe me, just search for "Code Quick" on eham.net, deja.com, and other sites.

"Separate and equal", eh? Why do you consider Morse code skill as
important as everything else in amateur radio combined?

Seems to me Morse code skill may be around 5% of what amateur radio
is all about. Seems Bill's and Ed's idea would work very well if
5% of the written exam was on Morse code skill.

People who were AGAINST code testing said that Morse code builds character
and keeps the riff-raff out of ham radio????? Give us an ever-loving break,
Larry. What an absolutely ridiculous assertion.

> >A message that explains why it is enjoyable, why it is

"Know code = know ham" gives that message????? Shirley, you jest.

> Ed, I've never done any "name calling" except within the confines of the
> small, closed society of Usenet.

Larry, Usenet is read world-wide by a large number of potential hams.
You have reached magnitudes more people on Usenet that you will ever
reach in person or over ham radio. You cannot possibly undo the anti-
Morse sentiment that you have caused.

> The only thing that kept the CW mode alive as long as this was the
> REQUIREMENT to learn it at levels which lead to operational proficiency.

I do not believe that is true, Larry. But if it is true and CW cannot
stand on its own merits without governmental welfare support, then it
deserves to be laid to rest in the sands of time. I believe CW will
endure because it has merits, the ones that you believe it lacks.

>
OH YA!

I had the opportunity to test one out when a school chum brought one into the electronics class. I suspect that any grunt under E3 would have ditched such a contraption on the first march. I thought much more horsepower than 40 watts worth was being lost to the tube filiments and gearbox and grease losses.

About the same time, one of the kid Novices (campus ham club) homebrewed a bicycle mounted QRP station that really worked The generator would keep the NiCads up between stationary CW ops. The 10 mile ride to and from school could just about do it.

I imagine that you could get a lot more efficiency today out of the manual generator. Not very practical for the rubber raft, but where would we be if the power grid went south for a month or more? For stationary power generation, wind and hydraulic are doable on a small scale, very cheaply with rewound alternators and such. One such contraption out of Pop Mechanix had a wind turbine made out of an 80 gal oil drum cut up like a rooftop vent turbine and spun on a wheel bearing. It drove a rewound car alternator to keep a battery topped off. About 90 miles east of here, is a vast array of wind turbines that catches the wind as it funnels through the pass just this side of Palm Springs, CA. It probably won't pay for itself, but it does put power onto the grid.

"Separate but Equal?"

Lemme see, if CW gets 5% of the written, and RTTY gets 5% of the
written, and AM gets 5% of the written, and USB and LSB each get 2.5% of
the written, and SSTV gets 5% of the written, and NBFM gets 5% of the
written, and FSTV gets 5% of the written, and Packet gets 5% of the
written, and psk1 gets 5% of the written, and msk...

We're already at 50% of the exam and haven't touched rules or
authorizations, let alone safety.

Code Quick probably works well at 5wpm. I could be wrong, but seems to
me, it wouldn't work above about 15wpm and would actually limit one's
maximum code speed.

w1rfi@aol.com (W1RFI)
shared these priceless pearls of wisdom:

->How would you feel about the test containing 5 minutes of Morse code at 5 wpm,
->and a reasonable number of questions about its content?

Ed...

As you know, I'm a proponent of the elimination of code tests overall, except perhaps the one that is of some practical use like the ASCII code {;-)

HOWEVER, if there is great feeling that somehow Morse Code is a relic to keep holy, then the 5 wpm should be straight text out of the newspaper or a schoolbook. Learning the code and then all the arcane jargon that is used in hamspeak at the same time is a rather daunting task. And yes, I'll run my college "RF Communications 101" class again this summer and yes, I'll teach the stupid code, and yes, I'll infect my students with the "this is stupid to have to learn" attitude. Perhaps if I can turn out enough students that will percolate to positions where they can do something about it, change will happen.

In politics, this is called the "septic tank principle". Most of the $#!+ flows down, but the really big chunks float to the top!!

Dog did it. Hmmm, starts with the word dog, and dog starts with the
letter "D" so it must be a d. Heck of a look up table you have to carry
around in your head.

Thank God we only need 5wpm anymore.

Two major problems, first a very faulty deregulation law. The second is a decrease in generating capability during a rise in demand.

Deregulation has caused the power companies to go so far in the hole that the only reason they are getting electricity from the grid is through executive order. This ends in two weeks. The suppliers are afraid they won't get paid.

The environmentalists have done a really good job of blocking any new plant construction as well. In short California has created their own problems, I say let them stew in their own juices. Maybe they can get the Clinton fund raisers to raise money for the ailing power distributors. 8>}

Personally, I feel, anything that happens to the fruits and nuts on the left coast is well deserved. Turn off the klieg lights at the porno film studios, the heaters at the faggot bath houses, and there will be plenty of electricity.

I am sure that the way I learned code wouldn't work above 15 wpm, but it didn't seem to limit my maximum code speed to 14 wpm.

To those whose primary reason for learning the code is to get their HF priveleges, Code Quick is as good a way as any.

Still begs the question: where did a 25% increase come from in 3 years after 7 of flat demand?
I have no doubt that you predicted it 20 years ago -- a simple extrapolation at that point in time would have done the job. As Peter Drucker once pointed out, had Rip van Winkle done his 50-year sleep act in 1913 leaving a 50 year extrapolation in his pocket, he could have looked at it in 1963 with great satisfaction, two world wars and a major depression not withstanding.

Using some QD estimates, 50 gigawatts is not enough capacity at 250 terrawatt-hours annually let alone 300 and probably does not even meet baseload today. This has been brewing awhile, no doubt about that. The village idiot is not going to let the legislature off the hook.

Also agree that home compooters are not a good blame-sink either. Servers, memories, etc. might be a piece but it is hard to see them as all of it.

I suspect that going back further and correlating to such things as population would give one a far better analysis which could not have been politically sold given the 1990-1997 experience in any case.

Still, where in hell did the increase come from - or as I suspect is the case, what is so odd about 1990-1997?

Dick

Do you believe that full-carrier, double-sideband AM and OOK CW using Morse encoding are both 5% of what ham radio is about? Why would you think a mode that is operated by only a couple of percent of hams is equal to one that is used by about 1/3 of hams?

The ARRL may indeed have selected those that are using the band right now, but
it is not the ARRL's place to decide that everyone can use it.

Are you interested in being one of the beta testers? I can find out if there
are any "openings."

Totally irrelevant, because the Maritime Distress System no
longer uses Morse signals such as "SOS" and in any event, it
never properly belonged in the Amateur Service, only the
Maritime Services using manual Morse telegraphy.

I would rather see questions on "good operating practice".

QFU is in the series assigned to the Aeronautical Services -
that series does not appear in the ITU Radio Regs so I don't
know its exact (legal) meaning. The "de facto" meaning is
obvious.....

Anyone have access to the ICAO Regs?

Top ten signs you're staying at a racist, Hiram hotel

10. Their slogan is, "We'll leave the WHITE on for ya!"

9. First tip-off: Those Confederate Flag pillow cases.

8. Sign in the lobby announces: "Pat Buchanan Rally This Saturday!!!"

7. Sign behind the front desk reads: "You're damn right we're open on Martin Luther King Day!"

6. Sign above the beds reads: "Absolutely no HIP-HOPPING on the mattresses!!!"

5. Sheets and towels already have eye-holes cut in them.

4. No rating by the AAA. . . but 5-stars by the KKK.

3. Bible on the nightstand replaced with a copy of "Mien Kampf".

2. Instead of a "Presidential Suite" they have a "Grand Wizard Suite".

And the Top Sign You're Staying at a racist, Hiram Hotel. . .

1. Every morning the front desk will give you a "wake-up slur".

The fact still remains that there is NOT any set freuency where
a ham can be reasonably sure that other hams are monitoring.
That is the bottom line. Ironic too that CBers maintain channel 9
as an exclsuive safety/emergency channel.

Cheers,

It is. The testing for the other modes is somewhat related to the relative importance of the mode to amateur radio.

If you think I was saying that all modes must be tested in equal percentages, you misunderstood.

Morse code is still in widespread use in the Amateur Radio Service, Bill; that alone is, IMHO, sufficient reason to have some testing related to its use. A decoding test is a long-time traditional way of accomplishing just that. The way it is being done today, however, sets Morse code decoding at a level equal to all of the other material hams must know. Doing what you and I have both suggested at times, with the questions about the content of the transmission being part of the overall exam, is a reasonable way to balance the need vs the testing.

> have a big red S on his sweatshirt.

I just read an op-ed piece in the Jan 29 issue of U S News and World
Report newesmag on this very subject and came away with a bit more
sobering knowledge on the subject, stuff you'd really rather not know,
or more accurately you'd rather wasn't so.
In a singlepage article entitled "The Price Isn't Right - it's easy to
forget there's no such thing as a free download" a fella by the name of
Randall Stross, who lives in that area writes, and I quote:

"...Does California's pitiful state seem due comeuppance for our
annoying tendency to lay claim to the future first? From afar, does our
degregulation mess seem comfortably distant from your own doorstep, or
precisely from your own power outlets? Do you still believe in Reddy
Kilowatt?
"Having just suffered through a temporary blackout here in Menlo Park,
Ca I am tempted to join in local demands that the thievin' power gougers

be brought to swift and rough justice. Yet I confess to feelin a twinge of guilt. For I personally contribute, in sundry ways, to the mismatch between electrical power supply and demand.I believe you too, dear reader, are culpable and will eventually be affected. Not because of the regional reach of the Grid and California Governor Gray Davis's (literal) power grab; and not because you may reside in one of the 25 other states now considering energy deregulation.

"Rather, the California crisis is larger than it may at first appear because it exposes a universal fact that has been overlooked: On our way to the digital future, we have been enjoying a free or near-free ride, a form of transportation that, regrettably, exists only in the land of makebelieve.

"In the news coverage of the crisis, much attention has been devoted to prices, narrowly defined as the mismatch between the newly unregulated wholesale price of electricity and the still-frozen retail price. Left ignored is other pricing that contributes to the present imbroglio: Flat rates for monthly Internet access and cost-free downloading of gigabytes of data, a combination that means the household that gobbles data like a University of Nebraska lineman in the college cafeteria pays no more than the Joffrey ballerina who only nibbles.

"The cost of maintaining websites...is absorbed by the site sponsers which
pay other companies to maintain "server farms". These are concentrated in Silicon Valley. A single such data center occupies the space of a modest office building but consumes the power of 10,000 single-family homes. Exodus Communications, the company which takes care of eBay and Yahoo! among other, has six data centers in just Silicon Valley, which will soon draw an estimated 25 percent of the area's power. (Remember, this is a state that hasn't built a major power plant in more than a decade).

"Feeling virtuous because you're careful to shut down your home PC every night? It's a laudable gesture. But the desktop PC consumes only 20 percent of the power used by the Internet. Add up the costs of running the routers, caching pages, cooling the equipment and so on and you'll find that to create and move 2 megabytes of data over the Net is said to require the energy
equivalent of a pound of coal.

"The Internet, that bucket brigade transferring data around the globe, sprang up without a master plan for commercialization, and there is no simple way to make heavy users pay the true costs. The famous 1954 prediction of Lewis Strauss, chairman of the U S Atomic Energy Commission, that electrical power would be "too cheap to meter" has not come to pass. But as consumers, we can take as large a byte of the Internet's vast offerings as we wish without having to pay a charge related to the volume of data ingested. Insulated from the costs, Web surfers will naturally enough take due advantage, heedless of what economists refer to as externalities, or the costs that someone else has to pay (or an entire city of someone elses, as when the next rolling blackout instantly makes San Francisco look like Lagos.)

Unlimited Internet access for a flat monthly rate is a luxury that Web

surfers in most European countries do not enjoy. It is not directly responsible for California's energy shortage. But the mentality that it reinforces, that using technology carries no marginal cost is plain wrong. Only five years ago AOL still charged its members on an hourly basis. Reluctantly, the $20 a month flat price set by independent Internet providers forced it too to move to a flat-price model. AOL then weathered an embarrassing breakdown of tis dial-up systems when users gorged themselves on the unmetered service.
At the time of the change, AOL head Steve Case sent an E-mail asking that members "moderate" their use at peak evening times during the transition. ("Just as you would be sensitive about using a public phone booth if there were others waiting in line") In just two days, his plea drew 17,000 messages from irate members, livid that he was hedging on the "unlimited use" bargain.
That, in microcosm, is the larger problem we will face as a society at some point: how to moderate use of energy-gobbling resources to which we currently have nearly unlimited access. Who would prefer the intricacies of cost accounting to the all-you-can-eat buffet? No one. That is, until the lights go out."

Oh, I don't know. He made a bunch of longrange CW contacts if you
recall. Also as has been belabored here so often, the code test early on
was at 5wpm.

For the record, I have never said the Morse code
exam was an ADA issue. I agreed with the FCC medical
waiver decision because the code test was not a valid
requirement; however, the decision was a technical
judicial error in that it did not waive the test for all, and
instead created more discrimination. Discrimination
by government are can addressed by "due process"
and does not always require ADA or Civil Rights
Act remedies.

I further believe that the FCC has dealt fairly with the
issue presented to it in the 1990 Codeless Technician
Decision and 1999 License Restructuring Decision.
And, I further expect the Commission, when presented
with the ITU rule S25.5 issue, will deal with it in a
fair and proper manner.

No, Bull, the "fact" is that in an emergency situation, it is normal procedure for anyone involved or interested in the emergency to repair to the State emergency net frequency. I wouldn't expect you to know that, given that you don't actually have that much experience in ham radio.
There are other frequencies generally active on a routine basis that are available for emergency service on an ongoing basis. The Eastcars and Westcars mobile service SSB nets on 7255, and Midcars on 72587258 are still active, at least Midcars is, as I sometimes monitor there. Most any repeater can be used as emergency comms, if only you can get anyone to answer your call. Then there is the Maritime Mobile Service Net on 14.313, if there's anything left of it these days after the trashing it got by thugs a few years ago and since.

But, of course, you're right - there is no "frequency" that is singularly monitored for emergency purposes. Instead, there are many. But you've got to know enough about it to know where to look.

It's quite clear that Bill has no use for ham radio for anything other
than just a very occasional, causual passtime, and thus he truly
believes that no one else does or ever has had, either. He evidently
doesn't read much or just ignores the emergency columns in all the mags
that have published reams on such activity by hams for far longer than
he has had a license.
But I guess that would be the attitude one could expect from a fella
who has very little actual interest in the hobby, and being employed in
a commercial communications endeavor he surely wouldn't advocate hams
handling serious traffic in competition.

Phil, that was the problem in a nutshell. "Liberal Deregulation", in
which the retail price is strictly controlled so as to definitely never
offend a single voter by causing him to have to pay actual costs (until
the lights go out, anyway) but unfortunately they forgot that they
couldn't control the prices charged by all those out-of-state suppliers!
Evidently they just closed their eyes and hoped the ship would hit the
sand so far in the future they'd be off the scene when the
recriminations started...

The KKK is alive and well. Recruitment is active all over the country (a friend was approached in Washington state and I've heard of recruitment around here). All Dees did was drive the KKK underground (into cell-like groups), which probably makes it more dangerious.

Reaganesque degregulated supply + FDR-style price controls and cost supports + the need for Sierra Club stamps on building permits = Deal with the blatently obvious results.
>
In the end, five-ten years out when reality is imposed amidst great howls of protest and anguish over actually cutting down trees to build generating capacity the Leftist Coasters will be paying 15-20 cents per kwh like us smokestack-loving fully-deregulated Fascist Coasters have been doing for eons. That's the real bottom line, pay for what the amp hours actually cost to deliver plus some (wash my mouf) profit or the lights are gonna go out. Not a palatable concept in places where a primary purpose of gummint is to protect consumers from reality, pore things.
>
Not that I actually believe it of course but our incarnation of Davis claims that deregulation saved PA consumers $2.18 billion last year. We also have *mothballed* generating capacity as a result of the profit-driven environment which got dropped on us and them a few years back. The 'lectric company here made money on excess capacity back then thanks to the foibles of regulation and now they can't so they took the excess capacity offline real quick but it's still out there.

Nevermind that even the professional emergency communicators have abandoned code long ago. If you like, I'll dig out the website where you can listen to the last holdout, the US Coast Guard's last CW transmission.

If you want to get saved, you'll have to learn to use phone.

There is a single HF frequency that is monitored extensively for emergencies,
Dick, at least while the band is expected to be open. Of course:

I didn't mean to imply that he didn't know the code. I don't know if he knew the code to 20 wpm when he did those early experminents. Seeing as this was before April 15, 2000, shouldn't he have done them above 50 MHz, where he belonged? :-)

I have to wonder, if the 5 wpm code test was enough to get Amateur Radio off to such a flying start (looking at the resultant growth), why is it looked upon with such disdain by some today?

I'm not sure of the context of these two messages.

Following the thread back, the mention was of Guglielmo Marconi, alleging that "he considered himself a ham." That is doubtful since Marconi essentially went to England to set up a profit-making business out of his radio experiments. He succeeded rather well, including getting as many patents and licenses-for-manufacture as he could. Hardly "not for pecuniary reasons."

Marconi got his S back from Poldhu in 1901. Radio back then was all about SPARK transmission (the Alexanderson Alternator would not reach its peak until around 1919). The ONLY practical means of communications over spark-transmitted radio was by on-off keying codes. On-off keying was the only practical means of amateur radio communications until the 1930s, regardless of a very, very few amateurs trying out the newfangled voice and music transmissions using vacuum tubes.

Okay, here we are in the year 2001, three generations removed from 1935. Radio amateurs are no longer dependent on on-off keying as the ONLY practical communications...there are many more modes, nearly all of them more practical than on-off keying. Why is there still an international standard requiring administrations to give code cognition tests in order to be granted a license having below-30-MHz-privileges?

Those who advocate removal of the code test for an amateur radio license do not view the retention of the code test with "disdain." It is viewed as unneccesary, archaic, and, in the case of so many that got rank/status/privilege through that singular skill, little more than an federally-granted merit badge. If there is disdain, then it is the disdain of those who wave that merit badge and badger others with it as some sort of "superiority" proof.

Were you implying that amateur radio got a "flying start" because of morse code? That's beggaring a definition considering that the ONLY mode for amateurs in the "start" was on-off keying.

Growth in US amateur radio: According to AH0A statistics the GROWTH occurring in US amateur radio is still due to the no-code-test Technician licensees at the end of 2000.

...the whole thread has evolved into a grandiose (and gratuitous) mini-
forum where everyone can trot out their favorite "hate" subjects and
expound on it as if they knew anything. Few do.

This morning's paper carries an interesting AP wire story on the
"PX" or Power Exchange in Southern California. The goal of the
California deregulation was to "lower electric power prices to the
consumer." That was the legislative statement four years ago.

Of course, deregulation hasn't done spit for lowering telephone
rates after deregulation of that...any telephone subscriber can
look at present and past bills to see that didn't work as advertised.
Cable TV service was essentially deregulated (in price) from the

beginning and needed some federal intervention in order to keep the subscriber charges from skyrocketing a few years ago.

To complicate matters in electric power supply-demand, CA started a "beta test" version of an "electric stock exchange." [AP story descriptions] The thought was that electric power is somehow just like stocks and/or durable goods that could be traded. The BIG players in electric power generation contracted with the PX and tried to ride that unbroken horse. Add to this that there were more customers for buying electric power than there were sellers. It became a sellers' market. Sellers sought to gain as much profit as possible by increasing electric power sales rates.

California electric utilities are bound by state PUC caps on rates they can charge customers. On one hand they became committed to buying electric power at terribly increased rates but could not pass the charge on to customers. On the other hand, they did not plan effectively in their own operations by assuming they could get electric power at reasonable rates and went into debt on outside-purchases. Since last summer there have been rather gross rate hikes on electric power sold. As much as forty times rate increase in one year...no change in existing plant facilities, just an enormous rate increase because the sellers were able to get away with it.

As a rather obvious but overlooked fact is that many of the moderate and small electric power utilities already had quite adequate generating capability, planned for it, and rode it all out. Proper management makes a difference. The Los Angeles Department of Water and Power is a moderate electric power player with 3.8 million customers. All through-out the "electric shortage" periods, the LA DWP not only kept on producing electricity but even sold excess to other utilities. The LA DWP facilites didn't need to build new plants nor did they get bound by PX contracts nor give in to greed.

If anything, S. David Freeman, GM of the DWP was criticized by Mayor Riordan of LA for selling power at nominal rates! Riordan's anti-up-state attitude is fueled by fears of not being able to be paid for DWP's sales...or it is some baseless fear that goes into being another politician.

General Manager Freeman has accepted an unpaid role in heading up a group that will attempt to reduce the crisis in politics-plus-bad-utility-management that lead to the much-publicized electric problems in some parts of California.

Politicians will criticize Freeman and other volunteers on whatever they do. The fact of the matter is that Freeman and others on the panel were able to plan and effectively operate electric power generation without having problems of being

forced to buy power at exhorbitant rates.

There is NO real lack of electric power generation capability
in the whole of this state. It is there even if this most
populous state (approx. 30 million) keeps growing...but the
management of the bigger electric utilities is suspect and
certainly the legislature is suspect of mishandling the situation
that began the whole scene.

There is no real problem from "tree huggers" nor some imagined
"left coast mentality" that caused the problems in part of the
state. It can be summarized in a single word: Greed.

Greed happens. Anyplace.

We weren't dependent on Morse Code as the "ONLY" practical
communications then.

Because most of the third world countries who, despite having NO
internal communications infrastracture in ANY mode, have the same vote
as those who have technology out the wazoo. Morse Code levels the
playing field for them.

> Those who advocate removal of the code test for an amateur
> radio license do not view the retention of the code test with

It is not my say-so that determines what words mean, Steve.

> I can't for the life of me understand why you support that creep, ...

I have found the incorrect useage of the term liar to be confusing. It appears you do not want to change your belief in what the word means, or at least you do not feel it necessary to use the word correctly, so I will simply assume you mean "incorrect" or "wrong" when you use the term "liar" or "lie." It is no big deal, but please do forgive me if I forget to keep track of your special meaning of the word.

Deregulation, and true Capitalism Yes! Pseudo deregulation and competition
No!

Had the power companies not been hampered in their expansion, you would see
electrical energy be dispensed in the same way that telephone and internet
services are today. Once the building of cheap sources of energy i.e.
nuclear power were stifled, the chance for competition was removed.

Remove all the nonsense regulations and your monthly power can be bought
from an energy provider for $19.95 a month. Some smart entrepreneur would
build an energy farm and become the next AOL of the power industry.

We do not have competition or a free market place in the field of energy.

Might be because the 5 wpm was required by the Navy to identify emergency signals to start. Later the speed was raised to provide trained operators for war time use of the military.

The problem today is couched in code speed, code is NOT the problem. The problem is watching any standard in any part of our life being removed be cause "I want it" attitudes. Not only are the IWI group never satisfied, but want to belittle any established rules of life.

It matters not if it is religious, morality, or code. "You" are archaic, elitist, etc. etc if "Your" values stand in the way of "my" instant desires. Once we move from the logical to the emotional, there is no easy solution.

We who had to do the code, do not have any real objections to it's removal for logical reasons, I dam well object to the snot nosed kids that think it should be removed because "they" think it is just being kept by the old (insert favorite expletive) who are standing in "their" way.

NCI the Madelyn Murry O'Hare of Amateur radio.

Nuclear, anyone? Four 2-unit plants would have provided more
than enough power to make this "crisis" disappear before it got
started. The fuel is readily available - in fact, a major
"crisis" in the eco-world is how to store/dispose of the
reprocessed fuel not being used.

But NIMBY-ism prevailed.

Only to the extent that one of the reasons (excuses?) for not building new capacity is that it takes years to get a construction permit past a bureaucracy overloaded with "environmental impact studies" types of endless regulatory pushups. Those were imposed by the tree huggers and there are a hulluva lot more of those local regs on the Left Coast than there are here. Dubya weighed in yesterday and announced that an administration objective will be to get the red tape cut and pave the way for building new capacity ASAP. Which in the end is the only viable long-term solution.

CELLULAR/WIRELESS technology is what's leveling the playing
field for them, bypassing wired and conventional single-channel
and multi-channel communications.

The world moves on...

The challenges before the advocates of nuclear power, and I am one, is to both re-engineer the concept in light of our experience with earlier generations of nukes and then sell it to a public that does not believe it. My lites are on at the moment by way of a nuke at Ft Calhoun NE that has run like a Swiss watch. While no one was watching the proportion of power done by nukes has risen in the US although none were built; they run longer and harder than they did when they were built. Kind of like jet aircraft vs the old prop jobs.

But there is a price to be paid and this may be harder than the engineering. Like any base-load plant only more so, nukes have heavy front-end costs but generate power pretty cheaply. The cost of long-term financing and the willingness of regulators (including Congress and the IRS) to allow the depreciation schedule to pay off the bonds is absolutely critical. The break-up of ATT was largely at ATTs request (as was the Communications act of 1934) because the Bell System had become the second-biggest borrower next only to Sam of long term funds in the US largely because the depreciation schedules from the regulators assumed crossbar exchanges would last into the 24th century. Kind of like NYC being solvent if the retirement plan used a mortality table from 1917.

Regulation of these things is necessary for no better reason that the front-end cost is a significant barrier to entry (which CA made worse by requiring new entrants to bear some of the 'stranded cost' of the old system. Stranded costs because of inadequate depreciation.) But the back side of regulation is that in return for limited tariffs, the regulator guarantees a profit. It is a bargain with the devil, more or less, but a very necessary one. If we are not willing to provide a planning horizon, it is a pretty fair bet no one is going to plan.

One of the minor joys of living on the Union Pacific mainline is to watch the coal unit-trains roll along I-80. Coal plants have similar problems but not to the extent of nukes and they are generally borne by a number of organizations in addition to the utility. Wyoming coal is low-sulfur to be sure but is dusty as hell and has about half the heat content of eastern coals. Coal has a place in the problem but no one wants to talk about the costs of extraction, transportation, handling, use, and disposal of the end products including Carbon 14 which is radioactive BTW. Disposal of nuclear fuel waste (although not obsolete plants to my knowledge anyway) is pretty well known.

And finally, if the benefit of nuclear power is to be fully realized, the peak-and-valley of demand patterns have to be muted a bit and that implies hourly metering and pricing. To cite an example, in the morning every coffee pot and electric range in existence comes on line. But does every electric water heater have to kick in as well? Is Madame Housewife (if any are left) incapable of noting that 2 PM is not a great time to dry a load of clothes? Perhaps in the long run of things natural gas would make more sense, particularly if the alternate use is to use the gas to make the electric power? Here is where the market's biggest advantage lies -- everyone making his own decisions with readily available information.

Perhaps the biggest single mistake regulators and politicians make is to assume consumers are idiots. Unfortunately, it is true that most viewers are brighter than Barbie and Ken doing the local TV news.

You are so right - but they are pulling the plug on further
development in the "small user" market.

But fortunately there is a White Knight.... Serenity Systems is
OEM-ing OS/2 client as a product called eComStation. Users of
that product say it continues where Big Blue left off at FP 15
and are very enthusiastic about it. It's bundled with updated
application suites and drivers, installs from CD, and is available
from Indelible Blue on a special upgrade deal for present OS/2
users.

I understand perfectly, Randy. The point was not about hobby
applications of AMATEUR radio, but of hobby applications of FRS.

QRM claimed that is was NOT a hobby service, nor was it used for
hobby applications. I differed with him.

No problem.

stand cowards....And this creep is a coward.

First of all...it's "Nursie-pooh". Please get it right.

Secondly, the rest is simply YOUR opinion. Unfortunately, you
demonstrate the typical Ugly American attitude that EVERYONE has waht
we have, and can't fathom anything EXCEPT the way we have it.

THAT'S dumb. There is still a large part of many countries that
still don't have cellphone forests in thier cities, and Amateur Radio
STILL plays an integral part of thier needs, if even as back-up for
commercial or military nets.

Let's hope your mother get's back in the mood for sex again. It
was nice while you were gone.

This was incorrect when you first wrote it, it was incorrect the next time you wrote it, and it was incorrect the time after that. It is now still incorrect, and will likely continue to be incorrect in the future, as it does not appear to become correct with either repetition or time.

Been there, done that. Just don't drop the CID deck of cards. The "green card"
eventually became a "yellow card".

Yep, 5wpm was plenty fast enough for me and thousands of other Novices
in the 1950s. It is difficult for anyone to use Morse code at 5wpm
without automatically getting faster in the process. After a year as
a Novice, I could do 25wpm. The only difference now is that we have
5wpm Generals instead of 5wpm Novices.

Read a little closer, Ed. The subject was the code 'test', which has
indeed been killed. But you'd think that 5wpm was just as daunting as
20wpm to hear the whiners go at it.

I'm about as pro-nuke as they come and I agree with you as far as you took it.
But there are two additional problems involved. First is the radiation
exposure paranoia (it says here) held by the Greens which was the primary
reason nuke-building was stopped. They have Barbie and Ken in their back
pockets. Chernobyl hasn't helped. Huge obstacle.
>
The second is the outrageous upfront engineering charges. The engineering of
every one of the nukes in this country was essentially done on the basis of
completely reinventing the wheel every time a new one was built. My
recollection is that the tab for the engineering of the Limerick plant was one
BILLION dollars. Never mind that dozens of nukes had already been online for
years before Limerick ever got to the drawing board stage. I'm in the
industrial mechanical design & build biz, I know bullshit when I see it, a
billion dollars +/- for a stack of drawings times however many nukes we have
is nothing short of one of the most monumental scams ever foisted on the
populace.
>
Of course my simplifcations can be argued over the horizon at the nit-picking
level.
>
The French did it right. They developed and locked down a complete design
package for a decent national-standard nuke and replicated the design
cookie-cutter style all over their map and buttered the one-time and done
engineering costs over the entire fleet. Today 60% of the power consumed in
France is provided by those cookie-cutter nukes.

Poor CB Dick. That's the real problem with lies. There's no basis in fact, thus they're not worth remembering. And Dick can't remember what he says from one moment to the next.

Here's what he said:

"I dunno. QFU isn't on my Q-signal list. I've never heard it on the air. Maybe he's coining a new one. Maybe that's another urban legend."

He goes all the way from "I don't know" and "Its not on my list" to "See Ed? I told you it was legal."

And of course he knows I've always been coded.

"1984" is alive and well in Tennessee, complete with "Truthspeak"
(or whatever it was called).

In reality this "incorrect" label of a "lie" is merely a statement of
a Belief System so strong that it becomes the center of the
known world for a Believer. Such a Believer probably uses an
Icon radio rather than an Icom. :-)

If anyone gave him a signal report lower than "599" this Believer
would hop up and down screaming "LIAR! LIAR!" :-)

More like 75 percent. [Source: World Almanac 2001, 59 reactors
producing 63,105 MWe, 1999] France is also the center for Europe's
nuclear fuel reprocessing.

Paris is often spoken of as "the city of lights." Maybe nowadays
it glows in the dark from another cause? :-)

Interesting part is that the USA has 104 reactors producing 97,145
MWe which is only 19.54% of total USA electric power in 1999.

Yep, Fox News reports that Clintoon's squad stripped it clean of all linen, dishes, silverware, everything that wasn't nailed down too tight to move, once it landed in New York. But they are NOT crooks, you unnerstand.
I think the people of Arkansas understand, too.

Once it becomes clear just what he sold to China he will have some sereious answering to do that can't be brushed aside with "depends on what the definition of 'is' is".

There were several standard designs outside the US, remember the Candu? A certain amount of that is power company people: coal installations had the same problem. Kind of like OTR tractors, some like Cummins, some like Cat. Probably some need to make everything fit the company theme but you are 100% correct.

Construction unions tended to view a nuke as an opportunity to cut a melon as well. Bruno and Guido even got into the act. When things are built in remoter areas the local sheriff is buyable for no better reason that he don't stand a prayer anyway.

Check stop!

If you had the single RAMAC disk on a 1620 it was a 1710.

OS360 came out when the Kingston Trio was big. Became known as the
operating system that never returned. Spent so much time housekeeping
that it only rarely came around to do any useful work. Now that was
bloatware.

Dick, I think you just implied that Morse code use is unable to stand on its own merits, and requires a government support system to keep it alive. How sad that you have wasted years of your life on the Morse argument and you came to the same conclusion that anyone with even half a brain could see. Could it be that you have less than half a brain?

If you were well read, you'd know what it was. Personally, I
think George Orwell was a genius.

As for "1984" being alive and well in Tennessee, I think you are
into the pot/kettle/black mode again, Lennie. You are The Master of
the re-worked word and you revel in it. Without it, you'd have nothing
to sling in this forum.

Your "Creep Mode" is only at 4.3 this morning Lennie. Try again.
You have done better.

Things succeed or fail because they possess merits or lack merits. You have
just implied that CW cannot stand on its own merits. If that is true, CW
doesn't deserve to survive. I think that you are absolutely wrong. I believe
that CW does indeed have merits.

Hi Ed...
Thanks again for your response. The only "byproduct" of my
suggestions would be the survival of ham radio in keeping with its true
tradition, its basis and purpose, its technological and economic value
to the USA, and the legacy of the silent key hams, who have done so
much to contribute to the technical growth of our hobby in the past.
It is sad that our nation's leaders, both Democrats and Republicans,
as well as most Ham leaders are taking paths that are not in agreement
with most intellectuals or with people who have firm technical and
scientific backgrounds. Our national leadership problems are evident
by recent editorials to be found in many reliable newspapers. The fact
is our leadership does not seem to be capable of making the kind of
logical decisions that are needed for future economic growth, power
management, overpopulation control, disease control, etc. The leaders
who evolve from liberal artists, lawyers, and religious leaders can not
blaze any path of success through the world's scientific industrial
competition and the serious problems that the future is sure to bring.
They can talk;
They can judge; They can pray...BUT they are not equipped to make
decisions based on scientific facts, which can only be accepted when

the proper logic is applied to the proper research.
New findings show that cancerous melenomas of the eye's cornea and
retina can be caused by the use of cell phones. The effect can be
explained to anyone who understands the basic principles by which
microwave ovens work. The near microwave frequencies can cause damage
to the moist areas of human eyes...but the extent of this effect would
not be caused by the longer waves used by ham's HTs on VHF (two meters).
The resonance effect of the entire human body and the penetration into
the human skull were the main things being considered when the
ANSI/IEEE safety levels were established. You can correct me if I am
wrong, but it seems that the ARRL as well as the FCC has accepted the
[probably] biased opinions of the ANSI/IEEE, which IMHO were made
solely to protect the cell-phone industries.

Please keep thinking.
Hams need more license classes.

73,
Bob Wex w2ilp (Insure Lighting Power)...don't get caught in the dark.

If men think that a ruler is religious and
has a reverence for the gods, they are less
afraid of suffering injustice in their hands.
--Aristotle (343 B.C.)--

It does me no injury for my neighbor to say
there are twenty gods, or no G-d. It neither
picks my pocket nor breaks my leg.
--Thomas Jefferson (1782)--

Our jails are filled by people who claim to
be religious.
--w2ilp--

Prayer alone can never solve scientific problems.
We must support more scientific education and let
religious education, like abortion, and ham radio,
be a matter of individual choice.

Many, many more than have amateur radio! Amateur radio transmissions
are banned by the current government of Afghanistan, and there is only
one active licensee in Chad.

Then have misperceived the entire controversy. I for one came on board
here a few years ago with the sole intent and purpose of offering a
little friendly insight on the fact that Morse on ham radio does indeed
have a velue. I was immediately set upon by a howling pack of jackels,
some of whom persist to this day. If you think I intend to just roll
over and hand the game to them you're dreaming. They can expect to get
in return what they give.
Why is it that you like to ignore all their BS and concentrate on what
code supporters do? There's no help for those people - their minds are
made up. To
quote the famous Brain Burke "I don't want to take no more code tests"
and
"I want, I want, I want" ad naseum. They're the "gimmie" set if ever
there was one.
Most of us code test supporters willingly accepted a 5wpm General
class license, but NO! We want it *ALL* gone, macht scnell! Bullshit!
They can eat cake. It'll be gone when it's gone, and they can go ahead
and stew meantine. And when it's gone ham radio will be a very much
dimninished affair, whatever remains.

My own experience -- I haven't been off N. America since 1967.

For examples, though, lets's start with China and several
countriez of the Middle East where 10 years ago there was
almost no copper.....nobody is stringing new copper, it's all
wireless.

Teh let's go on to Central and South America, where a former
chief of the FCC's OET (Dick Smith) has been heading up a
consortium to spread wireless telephony (cellular) in countries
like Venezuela, Peru, and Chile.

A good friend and professional colleague in SillyCon Valley -
Dewayne Hendricks, WA8DZP - is the founder and head technologist
of a consultancy that has already signed about a dozen
"third-world" countries to do the same. He's one of the more
vocal gurus of UWB technology.

Just for kicks he convinced the King of Tonga to let him be
the Domain Name czar (to mix pickles) and sell/assign domain
names ending in ".to" on the open market. Folks who can't get
".com" and ".org" names from InterNIC because they are taken can
now get the counterpart ".com.to" and ".org.to" from Dewayne....
when he's not attending meetings of the FCC's Technology Advisory
Council (or whatever they call it now) or playing upscale digital/packet
on the 5 GHz ham band with several of his cohorts.

> How many Afghanii's or Tchadians have cellphones?

A lot more than one would imagine but who said anything about
"the common folk" getting service? First come the politicows
and village/tribal chiefs.....

You might want to read N9GL's latest article at:
http://www.arrl.org/rfsafety/lapin/2001/01/30/1/
in which he points out that the exposure standards were established on the basis of observed effects of RF, without regard to the mechanisms that may cause those effects. That doesn't preclude those working in the field from trying to determine the mechanisms and to understand why the observed effects exist.

You missed the joys of the state-of-the-art AN/FSQ-31 which
was 2 IBM 7090s back-to-back .... with a 2-ft diameter disk
holding 128K that took 21 KW of manufacturer-required air
conditioning to make 75 degree +/- 2 degree air, while the
device operated in a computer room where the air was closely
held at 75 degrees +/- 1 degree per IBM specs.

The air handling system for the 'Q-31 had a 2-minute capacity
and a backup generator rated at 750 KW which could only make 2
starts in that time. Prime power had 4 - 375 KW rotary no-break
machines but SoCal Ed in their infinite wisdom only provided a
300 KVA transformer for patch-around when one of the no-breaks
were down for maintenance.

Ah the good old days of "Peace is Our Profession" (SAC - 1960s)

Yes, *IF* it worked as a lookup table, but I don't think it does.
I learned Morse with CodeQuick about 14 months ago, and I was explaining it to someone, and I found that I can't actually remember all the silly phrases and pictures, but I certainly have an association of the sound with the letter.

I don't mean to sound like a late-nite TV infomercial, ;-) but after about 2-3 years of frustration, trying everything, I went from 0-13 wpm with codequick. (I don't recall offhand how long it took, but it was pretty quick-- whatever about 1/2 the program is. maybe a month.)

Hey, everybody is different. It may not work for everyone, but it seems like a really good system to me, (because it worked wonders for me). I wouldn't guarantee it for anyone just because of how different folks can learn in different ways; But, I would suggest to someone that if they really wanted to learn Morse, and were about to give up because they couldn't, to try CodeQuick before giving up for good.

Larry Roll K3LT wrote:
> Five WPM isn't fast enough to approach the proficiency
> which would give a code learner the confidence to try out his skills
? on-the-air.

What I think Larry may be trying to say is what I call the ï¿½fun ï¿½ factorï¿½. CW communications can be conducted at any speed, low or high. The unfortunate truth is that the amount of fun you have conversing with CW is proportional to the speed you can comfortably clip along at. When incentive licensing was based on stepped CW proficiency requirements, there were two forms of inspiration for a new 5 wpm Ham. There was some level of fun (and frustration) obtained by using the code, but also there was the carrot hanging in front of him to upgrade to higher class of license. Now that the ï¿½upgradeï¿½ carrot is gone, there is less incentive for a 5 wpm Ham to stick with using CW long enough to reach a speed where the fun ï¿½ factor can really kick in.

A second problem will be the loss of the ï¿½kiddy poolï¿½, otherwise known as the novice band. The Novice CW band allocations are essentially empty now and will soon go away. During their hay-day, they were chuck full of hams pounding away in the 5-13 wpm range, all working hard to improve their CW skills. It was easy to find someone to talk with and it was only respectful for accomplished CW operators to slow down when visiting there. The new CW operator today does not have this warm shallow water to splash around in. He is thrown into the deep end of the pool and told to start swimming with the big fish. Would anybody be surprised if the percentage of new hams that grow to love CW is significantly less compared to when there were support mechanisms built in to help him along?

I look to specialty clubs to step up and save the day for CW. It is clear that the code haters have won the day and regulated CW mandates are soon to be history. Clubs like FISTS should set aside frequencies in the CW sub-band via gentlemenï¿½s agreements as protected waters for new CW operators. They should slow down and help the new CW Hams along. If it were generally known that the new CW operator could find personal support on the bands, then CW would have a brighter future.

Sounds like the antiques in the old 20th Air Division, Air Defense
Command, SAGE Blockhouse at Ft Lee AFS, VA. I had to forecast
probability of lightning so we knew when to switch off the commercial
power and start up the diesels. Couldn't let the AC stop or we would
burn baby burn!

Bombs on Target!

>wpm Ham.

Incentive Licensing was never _based_ on stepped CW proficiency requirements. The purpose of Incentive Licensing was raising technical proficiency (see Docket 15928). The stepped CW requirements that were a part of the existing license structure were a byproduct of the Incentive Licensing idea, not the basis for it.

A very well reasoned viewpoint, Jeff. For me, I don't think the fun factor was really related to any absolute value of speed. The frustration factor was more related to how many mistakes I made, or how well I could copy the other station. This is true at any speed I think. My change in speed as I learned was almost imperceptable to me. The sense of speed was and is a relative thing. If the other station is sending faster than the speed at which I can copy, it seems fast to me. But as long as he's sending at a speed that I can copy, then I'm comfortable and happy with it. It's fun. If I can't copy it, it's not so much fun. I've never felt that I had to get out so many words per minute or it wasn't worth my time. The fun was just in doing it. For those who feel they have a time constraint on their operating, then one of the other modes would probably be better suited to their needs.

I think your point about the "kiddy pool" (for lack of a better expression) is well taken. I've noticed that QSO's on the FISTS frequencies are generally at a more leisurely pace. I like your idea about perhaps expanding on that.

Nice post, Jeff.

Ah HAH!!! The truth comes out! The ARRL (through their Usenet spokesman, W1RFI) supports the concept of using inefficient, speed-limiting methods of learning the Morse Code strictly for the purpose of expiditing the granting of HF (phone) privileges! More "dumbing-down" from Newington! What else did we expect?

My choice of words is telling the truth, as it always has. If you are
so adamantly "Pro-Code," why didn't you support it by insisting on
retaining the status quo in testing requirements?

>Ditto for me. QRP interest is on the rise.

Is that among currently licensed, already CW-using hams, or
among new hams, recently licensed, and who just learned CW
for the sake of accessing the benefits of QRP operation? I'm sure
that if the truth could be known, it would support my arguments,
not yours. Mine are based on reality; yours are based on
dreamy, politically correct wishful thinking!

Lets see, now, there are hams in the USA numbering near 3/4 million, scatttered from coast to coast, border to border, and that ignores an equal or greater number scattered 'round the world. If you really think it might to be possible to gather them on a single frequency or to even agree on what frequency they might gather on, you're dreaming. I've been active virtually continuously for 44 years and never had to wonder where to go when an emergency struck. Done it a number of times. Have participated in lots of emergency and earthquake simulation drills overthe years on some of those frequencies.
Just what DO you discuss in your RACES planning?

That's not the point you made in the previous post, or the one to which I responded, Larry. Here it is again so you can keep your thoughts straight about it:

"Five WPM isn't fast enough to approach the proficiency
which would give a code learner the confidence to try out his skills
on-the-air."

I disagree that a lack of upgrade incentive makes the above a true statement.

> Keep deluding yourself, OM -- you're
> getting good at it, and I'm sure it brings you some comfort!

I was thinking the same thing about you, OM.

Another example of a pro-code-test advocate feeling a need to tear down the
mode in order to defend it. :-)

I made a world of 5 wpm QSOs when I first started, then 6 wpm QSOs and 10 wpm
QSOs and kept on going.

The QRPers are doing some really cool things with their "fox" hunt events, with
a slow-speed HF foxhunt once a week.

I think Cecil was telling us that he believes that some of the 5 wpm Generals will advance their code speed past the speed at which they were tested, like Cecil did with his 5 wpm Novice, or like I did with my 13 wpm General.

Some people don't think Morse code is good enough to attract users.

>I look to specialty clubs to step up and save the day for CW.

Some of the specialty clubs, like the QRPers, are doing just that. The ARRL Board has just issued a mandate to HQ staff to identify ways to promote Morse code use on the air.

>It is clear that the code haters have won the day and regulated CW mandates >are soon to be history.

Some who believe that Morse code testing need not be a part of amateur testing are far from code haters.

>They should slow down and help the new CW Hams along.

This will be the number 1 way to encourage those who are being licensed today to try out those Morse code skills.

>If it were generally known that the new CW operator could find personal >support on the bands, then CW would have a brighter future.

Some here who may believe that they are "helping" the mode survive ad not making newcomers feel like they will find personal support on the bands. Unfortunately, there is not enough on the bands to really make that happen, either.

The step from Novice to General contained a code-speed incentive from Day 1.

In the days when a General had all amateur priveleges, the technical step you mention was just as much a part of the structure of the licensing of the day as was the code-speed step. Both were made part of the incentive.

I don't see that you've disagreed with Docket 15928, Ed, which plainly indicates that Incentive Licensing had to do with addressing technical proficiency. Further, the reason IL failed is because hams weren't grandfathered to Extra from General. That was the complaint; not the difficulty of Morse.

So did I, and according to Larry, so did he. How he figures nobody would operate at that speed I'll never understand. Selective memory perhaps. My first CW QSOs were on my old 2 meter IC 211 - at sub-5WPM speed - when I was a Tech.

I was very happy just being a Novice in 1951. I was having so much
fun as a Novice, I completely forgot about the expiration date.
The only reason I got a Conditional was to be able to continue to
use CW on the Novice bands. The increase in my CW speed happened
automatically without me really trying or thinking about it.

How you can say yours are based on reality is beyond belief, Larry.
Hams are still learning the code. Probably a third or fourth of them
will use it a lot, including QRP, and develop proficiency. Human nature
has not changed in the last 50 years. I know you are hoping that CW
will cease to exist so you will be proven right but you are absolutely
wrong. CW has enough merits to survive your doomsday wishes for it.

Ed when you gonna get real? No one here is witholding any sort of
helping hand from anyone. The last thing the code bashers want is a
helping hand with it. You think Baby Brian Burke sat on his ass for 13
years in whining protest about the test because he wanted a helping hand
to learn code???
Yeah, I know...he claims to be "coded". Didn't say what "code". I think
I know. And it ain't Morse.

Oh, we have New Hams who are 5wpm Extras??? That may come as a
surprise to
the FCC database which shows virtually all new extras since April 15 to
be Extra Lites. Those very few who are that new to the hobby and also
grabbed off a 5wpm Extra at the same time probably won't stay anyway.
This can get to be a very boring hobby for the mildly interested and the
trivially involved. There's always the Internet with its instant
gratification.

That was a very common story in the early 50s. CW was king and 40w
AM sucked. If my Novice license had not expired, I doubt that I would
have upgraded for years. I was deliriously happy with my two 40m
CW Xtals for my Globe Scout.

Based on what statistical data?

Human nature
> has not changed in the last 50 years.

Yeah,we know....that's the very reason why darn few will ever bother to learn it at all when the code test requirement evaporates, and all the more reason why even fewer 5wpm types will even be interested in using it enough to develop faster skills. Sure, a few will be intrigued and spend a little time at it, at least until the new wears off and well before most ever gain sufficient skill to feel comfortable working higher speeds. THAT is human nature. And we already know your story line, you learned it in Cub Scouts well before you ever heard of ham radio. Or the Internet or any othe computer or radio or TV or or or or or.....Sorry those days are all gone.

Based on historical data, Dick. About 1/3 of HF hams use CW.

If hams chose to improve their CW skills in the past, why won't they continue to improve their CW skills in the future? You have such a negative outlook, I don't see how you force yourself out of bed every morning. Instead of telling us how lazy hams are and that CW is going to disappear, how about promoting the CW mode for a change? CW is fun for a heck of a lot of hams but it sounds like it is a chore for you, something you wouldn't have done without being forced.

No one said anything about "being silent" as "lying", Cecil.

At best, "being silent" is prudent, especially when one does not
have all the facts or can make an informed opinion. Or in the case of
your "example" above, it is in good taste since it's hardly a topic of
civil conversation.

At worst, it's evasive, however, as the saying goes, "Better to be
silent and thought a fool than to open your mouth and be proven one"

You've gotto be kidding. Engineering screw-ups all the way
down the line. The propulsion system, signalling system, and
communication system had to be completely redone, and they made
design decisions that locked them into very expensive non-standard
specifications and technology. The management team was almost
exclusively recent Pakistani immigrants who had a blank checkbook
to work with.

>A classmate of mine spent years working for Bechtel in the Near East

Why? :-)

Brian Kelly remarked that France had a single reactor electric
power plant design. I'm only pointing out that the USA has
45 more nuclear plants than France.

I'm wondering what the nucleus of this whole thread is...back
in 17 January 1994 a third of California was suddenly without
any electric power. [Northridge earthquake toppled one of the
intertie towers] Were any of the Southern California amateur
disaster nets activated then? Were amateurs prepared for
this? The professionals were prepared.

Just wondering... :-)

Leland,

My apologies in advance. Permit me a moment of poignant satire here.

I don't think you'll find ANY interest in WARC 2003 here in
rec.radio.cb. The ONLY thing of interest to this NG is:

1. Amps
2. Bigger Amps
3. Loud Radios
4. Big Radios
5. Lotsa "channels"
6. Coax Length

But then again you don't know. I would think anyone interested in radio as a
hobby would want to stay informed, even if it is just "educational". Of
course the conference is at least two years off, so the agenda could change
between now and then, and something of interest could appear on the radar
scope for somebody.

Many of those being licensed today do indeed demostrate knowledge of Morse letters and numbers.

But without our being willing to slow down a bit for the newcomers, we cannot expect that many will want to use the mode.

ATTA BOY VINCE!!!

You tell it like it was, is, and should be. Any license exams are
given with the INCENTIVE to study something...Even if it is dummed down
fixed Q &As, BUT for Ham Radio to have any real basis and purpose it
must act as an incentive to motivate more people to advance the state
of the art by advancing their own technical knowledge as HAMS.. If
people just want to communicate internationally they can use the
Internet or e-mail. If people want mobile communication they can buy
cellular telephones....
BUT
If people want to socialize with others who have technical and
scientific knowledge and learn more about what is in their equipment
then they just might want to be HAMS. If there are to be no such
people...then there can be no Ham Radio!....only Citizen's Multi-Band
(CMB).

Hams need more license classes and/or official FCC technical
endorsements.

73,
Bob Wex w2ilp (Incentive Licensing Proponent)

I don't want to belong to any club that would
want to accept me as a member.
--Groucho Marx--

The Quarter Century Wireless Association is
thinking about increasing their membership by
accepting as members Hams who have been licensed

less than twenty five years. I guess they
might want to change their name to the
Micro-Century Wireless Association or maybe
the Less than Two-Bit Interconnected Modem
Association.
As of July 2001, I'll be a Ham
for Half a Century. OH Well...$49.99 always
sold better than 50 bucks....but I don't think
you can sell more Ham Licenses For $9.99 than
you can for ten bucks....I could be wrong
because the kind of Hams they are now loooking
for are not supposed to be wise to any penny antics.

Well, wouldn't QRP be politically correct? It doesn't pull much power
off the grid so it cuts down on pollution and can easily be run off the
grid from solar power. Not much TVI/RFI either.

>
> Jon

Yes and this is one time I won't say "Speak for yourself Jon". You and
N9GL had better read the very latest research on the cancerous eye
damage attributed to cellular telephone RF. I should have saved the
references that I had read. The research was done in UK.
The mechanism and the effects are known and established.

Anyone who professes to be an RF hazard expert had better keep up with
the latest research. I'm just a ham. The education and the ham exam
knowledge that I have attained have not qualified me to call myself an
RF Safety expert....
BUT
I read a lot of medical newsletters because I am interested in a lot of
medical problems that I have...and I saw this very recent research,
which reinforces my opinion that cell phones use can be dangerous to
our health...or at least our eyes' inate ability to inhibit cancer.
The IEEE/ANSI specs, I am convinced, were made to give a clean bill of
health to cell-phones...but not Ham Radio VHF gear. Unfortunately it
might take time, more research, and sadly some blind cancer victims
(and their lawyers) for me to be able to say "I told you so".

When the sun is too bright...BLINK!
When you want to use a cell-phone, that won't make you blink
automatically...THINK!
Maybe cell-phone users need RF filtering sun glasses. I dunno. I

don't generally start by seeing the world with rose colored glasses myself...but odds are I'm not wrong.

Other recent researchers say that they have been able to increase or decrease the speed of light. I say that they are not talking properly about group photon velocity. They have not changed the speed of any light. They have just been able to demonstrate the control of its group velocity in such a way that they appear to have changed its speed but the speed of light, in media of constant density, is a constant of physics that can not be changed, in spite of the fact that light energy can be controlled in a manner that apears to accelerate or delay it. Einsteins special theory of relativity would not be necessary if we could believe that the speed of livght is not a constant.
Now, as a student of physics I understand this, as well as I understand some of the ignorant press releases that attempt to describe superconductivity (which are misunderstoood even by many engineers). I could be wrong because I myself am not a researcher or a medical eye specialist... but from what I understand the MECHANISM is certainly there to cause eye damage at 900 MHz RF... but not a 144 MHz RF.

Hams need more license classes. Maybe even an RF hazard specialist class.

...and where did I call the methods in use by others wrong?
I pointed out that State was, during the time discussed, using Morse.
It was and I stand by my statement.

> >> Technically, switching over to CW from FSK TTY should be

> frequency for an order-wire have more advantages than having
> the circuit commands sent over the TTY circuit?

The story hasn't changed one iota. You didn't bother to ask the why of
State's use of Morse.

Picture a scenario in which propagation changes cause a loss of path.
Picture an op using one of several CW guard frequencies to coordinate
the reestablishment of RTTY communication. Picture the necessity of a
crypto key change each time operation began. Opening of business,
call-ins for Night Action traffic, etc.

> >I stated that CW was used to arrange QSYs, openings and closings of the

State does not use digital voice to send and receive daily message
traffic. State is not the Army. State does not use SINCGARS. State
now uses no HF at all for daily message traffic.
>

What we need is an easy to get license that allows novice CW ops to
practice with each other on the air by using a small band segment set
aside for just this purpose...

In order to do what? I don't find myself feeling limited by the number of license classes in the ARS. Necessity is the mother of invention, not wallpaper. Interest and curiosity must provide motivation. Without that I think you'd have to convince the US Treasury to issue their certificates rather than the kind the FCC offers.

My thought was that that isn't really something that you support. It seems a lot of the discussion around here centers around the fact that there isn't any longer a reason to test for this kind of thing, and I just thought this might be one reason that it's not entirely without merit.

> But without our being willing to slow down a bit for the newcomers, we
cannot

Another one trying to tear down ham radio to be "right" in a debate.

We knew the type in grammar school; they are apparently still with us.

Don't be surprised if not many people want to follow you as you try to drag Amateur Radio down to your level, Larry. Many of us still believe in the values you used to attribute to the Service.

If you really feel this way, perhaps we would all be better off if you let your license expire and found something you can believe in to do.

When that license is available, very few hams wanted to obtain it, so the FCC chose to drop it.

Any ham license allows prospective CW ops to practice with each other on the air.

You amuse me, Larry. First, you keep insisting that Morse Code all-important to all of ham radio and that the Morse Code testing requirements are sacred.

So I decide to bring Code Quick to the attention of everyone on USENET. Unlike more conventional methods, Code Quick works, and people ACTUALLY follow through. So what do you do? You try to knock it down!

I can tell from personal experience that Code Quick works. Because it takes the drudgery (memorization of dits and dahs, listening to CW and waiting for divine inspiration, etc.) out of learning CW, it seems that everyone who tries Code Quick sticks to it. You CANNOT say the same about other methods.

I challenge you to find anyone who tried Code Quick but failed.

I will agree with you that Code Quick alone isn't enough for 20+ wpm. Well, at some point, the Code Quick user has to start copying in his/her head. But at least there's nothing to unlearn.

Larry, you obviously do NOT need Code Quick. But the "lazy No Code" crowd certainly does. Show me someone from this group, and I'll show you someone who didn't use Code Quick.

I think you are way over the top here Ed. Larry is upset because the standards have been lowered by people who felt they "deserved" rather than earn an amateur radio license.

You then tell him he should let his ticket expire because he disagrees with it! As much as I respect your efforts in ham radio, I despise the attitude you are displaying towards older hams.

I have to look at you as a representative of ARRL, and by extension infer this is the current attitude in Newington. As such, I will not be renewing my League membership and will be resigning my positions as Technical coordinator, Official Observer and County EC.

I didn't say they weren't. I only said that according to N9GL, the standards are not derived from the mechanisms but from the known effects. Which makes sense. For the purpose of determining safe levels, the mechanisms are unimportant -- only the effects matter. (Again, that's not to say the mechanisms aren't of interest in their own right.) I think they do extrapolate animal tests to the human body since I doubt anyone has yet volunteered to be slowly cooked by RF for scientific purposes.

Apparently you don't hold yourself to the same high standard since you are convinced of a conclusion that you admit cannot be supported by present scientific evidence. Hopefully, those non-scientist leaders will refrain from making scientific judgements on topics they are unqualified to evaluate. Maybe you should, too. And particularly, you should refrain from denigrating the professional abilities of people like N9GL when you clearly know nothing about them. You frequently proclaim that your views are based on science, but it's pretty clear in this case that prejudice is playing the bigger role in forming your opinion.

Of course my comment was a tongue in cheek view of the present state of the CW mode. When the Novice license was created, it was a very popular license indeed. It allowed thousands of beginning hams to practice with *each other* while having the fun of being on the air. You did not have to beg old timers to slow down just to nursemaid the few and far between CW recruits that we have today...

> minutes) on 12 meters several years ago.

I am not even sure that what I heard WAS one, however I was
hearing the last one or two dit's or dah's on 80 meters with signals
about S-3. I listened on 40 but couldn't hear anything. I am not up
on 160 at the moment so couldn't try that one.

I was hearing the return "dit" almost simultaneously as I go off
the paddle (in full break-in).

Fun stuff.

73 and thanks, Hans.

SAGE stood for "Semi-Automatic Ground Environment".

For those here under the age of 60, SAGE was an Air Defense
Radar and Tracking system of the 1950s era using lots of vaccum
tubes and defense budget money to make the Systems Development
Corporation very wealthy -- SDC was the "darling child" of the
Air Force in those days who had the contract for the programming
and data analysis on that system and others.

The point is, Leland, when you crosspost these things to a list of discussion groups, the responses to your 'spam' then also go out to all of the groups you listed. Since these are discussion groups, people will respond to your posts, and in many cases unknowingly spam the same list of groups you did. What happens is we end up with hams posting to CB groups, and CB enthusiasts posting to ham groups, and each of the groups ends up with four times the normal amount of posts in a given thread, and FRS users get to find out how big an Ahole joe ham is. So if you feel you absolutely must post to all of these groups, then it would be more considerate to everyone for you to take 5 minutes of extra time and post to each of the groups individually.

Thanks,

AC6XG

Cecil fits the data to the circumstances, yet again.

Find one then we'll discuss it. Dare ya.

I know a few pre-2000 Extras who are also PhDs. It doesn't take much
imagination to conceive of some post-2000 Extras with PhDs who know
Morse code. So would you please answer the question instead of evading
it? I'm sure there are Generals who can do 20+ wpm and are upgrading
to Extra as we speak. Exactly how can these "pseudoExtras" prove to
you that they are faster at Morse code than you are?

I suspect PhDs in EE know a lot more about "amateur" radios than you do.

I know a few PhDs who are Extras. Why is it such a stretch to conceive of
a General who does 20+ wpm upgrading to Extra in 2001?

Typical Cecilian troll -- sigh.

What does a PhD in EE have to do with amateur radio? (Keyword "amateur")

Besides, I thought your mythical Dr. Williamson didn't do Morse very well?

In defense of the ANSI/IEEE standard, it was promulgated in 1992, based upon research over the previous four years. A lot of new research has emerged in the past 9-10 years in this field, that may yield a new iteration of the standard in a few years. The old standard was based upon a number of criteria, including whole-body resonance frequencies, and particularly human head resonance for optimal SAR. There are a lot of variables as to which organs are the most vulnerable of course, and the researchers tried to include all these in the standard, which is generally considered somewhere between a factor of 2, and a factor of 10 below the threshold of tissue damage. If new research on the eyes contradicts these earlier findings, so be it. We can adjust the standard a bit as we go to ensure (almost) total safety. There are web sites out there that list the power densities from the most common cell/pcs phones on the market. A person might be well advised to review those before making their next purchase.

Summary: This is still not an exact science; we are still learning. Even if we erred, we thought, on the conservative side, we may find other effects that we overlooked before that will have to be taken into account in the future, including non-thermal effects.

So you claim to know as much about radios as PhDs in EE?
Got any proof? What sampling rate does it require to
reproduce 455 kHz IF information?

At the height of the best sunspot cycle of all time, we hams at
Texas A&M could send a 'didit' on 10m and hear it coming back
from around the world. It was smeared but it was there.

There is a story about a kid from a farm just outside of Glendale, WV and one of the local bars there.

The kid's name was Roger.

It seems that he had just turned 21 and his father let him go into town alone to buy supplies and feed. Since it was his first trip to town as a man, his dad told Roger to go ahead and buy himself a beer while he was there.

Roger finished up at the feed store and went to the bar to do as his dad said he could. He ordered a beer and the bartender asked if he was new around town. As he was telling the bartender his history, a stunningly beautiful young woman came into the bar and sat down beside Roger. Roger was so powerfully affected by her presence that he began to lose track of his conversation with the bartender and to stammer just a bit.

He turned to the girl and attempted to start up a conversation with her, but she seemed to be distracted. She always answered him politely, but acted as if she didn't really want to talk to him.

A few minutes later, a second beautiful girl entered the bar. She immediately struck up a conversation with the first girl, and eventually they left the bar together.

"Don't worry" said the bartender "she wouldn't ever have gotten interested in you. She's a lesbian."

"What's a lesbian?" asked Roger.

"Well see, it's this way: Lesbians only think about girls. They want to hang out with girls, they want to kiss girls, and they want to sleep with girls."

"Get it?"

"Um, yeah" Roger said, and then left to bring his supplies home.

A few weeks later, Roger was back in Glendale and he stopped at the same bar again. After he'd ordered a beer and was sitting there drinking it, a talkative stranger entered the bar. He was a salesman and told Roger all about how wonderful his job was. Eventually he said to Roger, "Yep, I'm a salesman and proud of it. What are you?"

Roger blushed, looked at the floor, and said "I'm a lesbian."

2317. STAGGER LEE, OUTED SPERM_GARGLING HOMOSEXUAL

In article <3A79EFCE.2A8C8D9E@houston.net>,
AIDS CARRYING HOMOSEXUAL Stagger "FUCKWIT" Lee <SLee@houston.net>
slobbered:

> There is a story about a kid from a farm just outside of Glendale, WV

I live IN town..not on a farm, FUCKWIT SPERMGARGLER. Even though you
live in a tarpapered shack outside of town,
mainly because the TOWN issued a petition forcing you out of town with
your depraved,
perverse sexual exploits with other men and farm animals.

<...>

> "Well see, it's this way: Lesbians only think about girls. They want
> to hang out with girls, they want to kiss girls, and they want to
sleep
> with girls."

Proof positive "Stagger Lee" here IS a HOMOSEXUAL. Stagger Lee here
thinks sleeping with girls is somehow unnatural. Yep, I ONLY want to
sleep with girls/women, Faggot Lee. Nice to see you finally come out of
the closet! Yep, I want to kiss "girls", which beats the men's schlongs
YOU like to kiss, Shithead Lee. Yep, I want to sleep with "girls/women"
again it beats the farmanimals you currently have sex with.

Your little "joke" kind of BACKFIRED, since you maintain I like to have
sex with women!!!!!!!!!!!!

> Roger blushed, looked at the floor, and said "I'm a lesbian."

Yep, using YOUR definition of a "lesbian", I perfer women.
I even ate out your whore momma's cunt...BWHAHAHAHAHAHAHAHAHAHAHAHAHA!!
The best $10.00 I ever spent! <peals of derisive laughter>

"Stagger Lee" <Koko Taylor>

2000, Xmas eve, with a full moon over town
Stagger Lee sucked off Billy DeLions
And he blew that poor boy's dick.
Do you know what he sucked him for?
What do you make of that?
Cause Billy DeLions threw the lucky dice
Won Stagger Lee's Stetson hat.

Bayo, Bayo, tell me how can this be?
You arrest the girls for turning tricks

But you're scared of Stagger Lee.
Stagger Lee is a madman and he sucked my Billy D.
Bayo go get him or give the job to me.

Delia DeLions, dear sweet Delia-D
How the hell can I arrest him? He's twice as big as me.
Well don't ask me to go downtown, I won't come back alive [no more].
Not only is that mother big but he packs a .45 [four].

Bayo, Delia said, just give me a gun
he sucked my Billy's cum now I'm gonna see him hung.
She went into the DeLion's club through Billy DeLions cum
Stepped up to Stagger Lee at the bar,
Said, "Buy me a gin fizz, love."

As Stagger Lee lit a cigarette she shot him in the balls
Blew the smoke off her revolver, had him dragged to city hall
Bayo, Bayo, see you hang him high
He sucked my Billy dry and now he's got to die.

Delia went a walking down on Singapore Street
A three-piece band on the corner played "Near My God to Thee"
But Delia whistled a different tune, what tune could it be?

The song that woman sung was "Look Out Stagger Lee".
The song that Delia sung was "Look Out Stagger Lee".

BWHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHA!!!!!

Well Ed, you're not nearly as sorry as I am. It really used to be fun
to help younger folk learn, both theory and code, back in the days when
younger folk were actually interested in learning. I remember one winter
in the 70's the Vo-Tec electronics teacher and I spent months teaching a
ham radio class, and graduated a bunch of new hams. I truly am sorry
that times have changed so much, and more's the loss for ham radio.

>From: "W4JLE" Fred@w4jle.com

>As much as I respect your efforts in ham radio, I despise the attitude
>you are displaying towards older hams.

It is not the older hams that I despise at all, Fred; it is the despicable way that a few of them are treating the newer hams.

>I have to look at you as a representative of ARRL, and by extension infer
>this is the current attitude in Newington.

If you want to know the position of ARRL, Fred, you can do so by reading QST or the ARRL web pages. If you want to know my personal views, you can read them on rrap.

>As such, I will not be renewing my League membership and will be
>resigning my positions as Technical coordinator, Official Observer
>and County EC.

Do you really feel that the work you have done is less important than forcing me to never post views contrary to yours? I feel that such work is important and it is unfortunate if you choose to abandon it.

If these discussions will result in the people on this forum holding such actions over my head, perhaps my usefulness here is coming to and end.

Would you like to reach an agreement that you will remain doing what you are doing and I will never again post a personal view that is contrary to yours? This seems to be what you are trying to accomplish. Have I read your intent correctly?

In my experience, younger hams are very much interested in learning. I don't think I would find it so if I were to keep telling them how dumb and lazy I think they are.

> I truly am sorry that times have changed so much, and more's the
> loss for ham radio.

Maybe someday, times will change for me, but to date, I still see the ham radio you once did. Perhaps it is not the times that have changed, Dick.

Is that really a doctorate-level question in your view, Cecil?

The ARRL Handbook chapter on DSP explains it handily.

You can also find the answer at:

http://www.arrl.org/tis/info/dsp.html

The premise of a doctorate is that the candidate has performed and documented a significant original work. It is unlikely that the question you posed would be asked of the applicant when the candidate defends his or her thesis.

So, let me understand this... Larry calls people names, so Ed calls Larry names...

You are so busy towing the "party" line, you have no respect for anyone who disagrees with it. Is that the way to convince the old hams you are correct? Or do you only take that deferential position when referring to new 5 WPM hams?

Let me restate Jim, I can see how what I said could be confusing.

I meant by "older Hams", that group of amateurs who had obtained their licenses under the pre 4/00 rule changes.

There seems to be a one-way street working here, bend over backwards for the new guys (Which I have no problem with welcoming and helping anyone regardless of rule dates) while denigrating the efforts of the "old hams" as ego, pride, elitism, and other terms that imply that if you are not 100% in agreement, you are a less than desirable person. One who's opinions do not matter and are fair game for abuse.

Larry can be a bit of a hardnose, but he is equally correct in his beliefs as anyone else on here. To see him abused by a member of the ARRL staff is so far over the edge, I had to state my feelings. With the exception of Cecil, I think everyone on here has some level that once it is reached. they make a decision to do something else rather than be associated with the abusive group.

The code/nocode has gotten so far out of hand that I don't think we will ever see a resolution in any near future. Bad enough that those that disagree had to grudgingly go along with it, now all the nah nah na nah nah's from the no code folks that feel they have to dance around in glee. Cheered on by no less than Mr. politically correct.

Honest! this is my last word ever on the subject of Code/No Code.

Many hams fit into both per and post 4/00 changes. I've been licensed
since before 1960 but only have been an Extra since June 00. Frankly,
I see this entire concern or focus on when someone was licensed as
just a waste of time.

>There seems to be a one-way street working here, bend over backwards for the

>agreement, you are a less than desirable person.

Personally, I think those that find a need to personally claim
they are better than others because they passed a test (pre 4/00
or whenever) are the ones with the ego problem. I see absolutely
no need for people to puff themselves up because they are
any particular license class. How good a ham someone is
has far more to do with what you do with the license you have rather
than the license itself.

The code/nocode debate will be resolved with WRC-2003 and then
subsequent changes in eac individual administration's test
requirements. Remember, the issue is the code TEST, not
the use of or personal like/dislike of code as a mode.

>Bad enough that those that

Who's dancing in glee. The requirements have been changed
and we move on. I see more grieving and complaining from those
that disagree with the new requirements than the converse.

That little tidbit has absolutely nothing to do with amateur radio. The fact that some receivers use a 455 kHz IF might.

So here we have a total condemnation of all youth by Dick.
Are there truly no youth that have a desire to learn anything?
Me thinks ole Dick doth exaggerate a tad. The issues today as to
why youth don't gravitate to ham radio as much as in the past
has more to do with the alternatives youth have today and
the less "magical" aspect that radio plays in our lives in
general. WE, the already licensed, have the obligation to
pro-actively make ham radio known to as many youth as we
can. If we don't, then we have no one but ourselves to blame
for any lack of new hams.

Where on earth do you find any younger hams today???

I don't
> think I would find it so if I were to keep telling them how dumb and lazy I
> think they are.

It's not the non-existant younger hams who are dumb and lazy. It's the
TESTS that are *dumbed down*, and the 12-15 year or more *middleaged*
hams who have sat and whined about having to pass a code test to get a
HF ham license who are generally considered to be lazy. Got it?

Sampling rates have nothing to do with amateur radio? Sez who?

Of course, Cecil's question lacks sufficient detail to give a numeric answer. And you don't have to be an EE to know that -- just read the Handbook.

>
> Nope, but I'm not a PhD. :-) And I'll bet 99% of hams don't know
> the answer.

But any one of them who found that he needed or wanted to know could easily come up with the answer.
And 100% of hams have no imperitive reason to research the answer, as might the small percentage of EEs who need to know that in their particular specialty line of work.
If one can be a complete, successful, *real* ham with nothing more than answering a few questions which have their answers provided in advance, why in the world would any serious number of them feel a need to even ask? Most have no idea what you're talking abouit.

Cecil will never get over it. His EE didn't qualify him for an Extra class ham radio license until the Big Dumb Down, and he still squirms because of it.

Fine business, Fred. How do you see the Amateur Code as fitting into the
kinds of opinions we see expressed here by some of these older hams?

SAYS I, of course. It's the TERM that has nothing to do with ham radio. "Sampling rates" are important only to those who prefer to think in such digital terms, for their own reasons. Only when a theorist decides to describe the world in digital terms ascribed to analog systems dot hose digital terms take on importance. The rest of the time the world of ham radio turnsd quite well without them. It did before the first theorist decided to describe the operation of an IF in terms of "sampling rates". It continues to do so to this day, in spite of your leaping to show your grasp of all this new description of old phenomena. So you can calculate whatever that rate might be said to be. So what? It changes nothing whatever of the system, and I guarnatee that I can design and build an IF chain without ever having heard of the term "sampling rate". So as far as the operation of that chain--and the vast numbers of they that have gone before- it means nothing whatever. It just means that some theorist decided to view the world in his own terms.

Simply untrue. There are many -- including participants of this forum --
who disagree with the changes and who Ed has never so much as gently
chided, because they have expressed their disagreement while maintaining
respect for those who in turn disagreed with them.

> Larry can be a bit of a hardnose, but he is equally correct in his beliefs
> as anyone else on here. To see him abused by a member of the ARRL staff is
> so far over the edge, I had to state my feelings. With the exception of

> abusive group.

Larry has stated repeatedly that any ham who has not passed the same
exams Larry has is a lesser ham than Larry. He is not "equally correct"
in that belief although he is, of course, entitled to hold that, or any,
opinion. Ed finds Larry's view distasteful. (So do I.) You may not. But
it is incorrect to say that when Ed expresses his distaste for that view
and the attitude that underlies it, he is denigrating that group of
amateurs who obtained their licenses under the pre 4/00 rule changes.
For one thing, he'd be denigrating himself. For another, the members of
that group of licensees by no means all subscribe to Larry's view of ham
strata. In my experience, very few of them do.

Reviewing the exchange that Ed was referring to:

Larry Roll K3LT wrote:
>
> In article <3A76E8A4.CD47059E@IEEE.org>, Cecil <Cecil.A.Moore@IEEE.org> writes:

> doesn't it?

The attitude expressed by Larry deserves, and got, censure. In brief, Ed attacked the views and attitude expressed by Larry. That does not constitute an attack on all older (by any definition) hams, or even an attack on those who believe in code testing. It is merely an attack on an unconscionable denigration of the innocent.

> The code/nocode has gotten so far out of hand that I don't think we will

Those who belittle hams who did not obtain their licenses under the old system deserve to have that behavior treated with comtempt because it is comtemptible. That has nothing to do with one's opinion of the value of code testing.

If I understand what you are saying, "sampling rate" is just a term used to describe analog systems in digital terms. Well, that's a peculiar view. The purpose of sampling is to transform continuous-time (analog) data to discrete-time data so that it can be processed by discrete-time systems (digital computers). That is far more than just a theoretical exercise. It has practical, real-world application.

Of course it is possible to build a radio without sampling. No one said it wasn't. But that's not the question. The question is, does building radios that make use of sampling have anything to do with ham radio? When people build radios for amateur use that do use sampling, are they not pursuing ham radio? I think so.

Look, of course it's not necessary for hams to understand sampling in order to pursue ham radio. What I don't understand is why you react to Cecil's prodding by taking the polar opposite view that says that technologies that are in use in ham radio but that are not the technologies you prefer "have nothing to do with amateur radio." Im my view, that is not one whit different from those who denigrate CW because it doesn't interest them, which attitude you have decried more than once.

Jon, I think Cecil's point flew right past you. He indicated that a Phd EE automatically knows more about ham radio than a ham without the degree. I say nonsense. I'm sure you could easily find a Phd EE who knows all about sampling rates but who has never heard of ham radio.

There are a couple of ham transceivers already on the market using that generic technique, Dick. If you weren't living in the past, you would know that. In the future, more and more top of the line amateur radio transceivers will use digitized IF techniques.

I obtained my current license under the "pre 6/63" rule changes, but I
have no reason to believe that someone who got their license as recently
as yesterday is any less qualified than I am. In fact, some might argue
that they are likely to be more qualified since their examination was on
topics more advanced than my examination.

> To see him abused by a member of the ARRL staff is so far over the

What "abuse"? W1RFI is one of the most even-handed contributors
to discussions here, stating his views politely and clearly without
abusive language. We don't link your comments to your employer, and
Ed is careful in all cases not to link his comments to his employer,
so your gratuitous slam at ARRL is unwarranted.

I've known many EEs whose knowledge of ham radio was scanty. Just
because I disagree with something you said to Cecil doesn't mean I agree
with him. If you had said that an understanding of sampling rate was not
needed in order to participate in ham radio, fine. But when you said it
has nothing to do with ham radio, I just had to disagree.

Jon

Dick, Dick, Dick, most top of the line ham transceivers use sampling rates right now. A few of them sample at the IF frequency. Even my $1000 IC-706 uses sampling rates. Any Extra who doesn't want to understand sampling rates chooses not to understand modern day ham radio. You are burying your head in the sands of time. As time moves on and progress happens, more and more of your precious analog functions will be replaced by DSP techniques.

That might be useful at the depth of the sunspot cycle. :-)

Really?

Go down to the r.r.a.p. machine room and tell them to empty the
bit bucket, and FAST, before that baby overflows.

First off, any competent-in-DSP bench technician (let alone PhD EE)
would scoff at 455KHz as a proper IF choice for DSP techniques.

Second, that same technician would scoff at the simplistic nature of
your question, in that it displays a basic ignorance of the information
needed in determining what sampling rate to employ.

Actually it has a lot to do with how many downconversions have to be made before an ADC can convert the signal for use by a DSP. Right now the DSP rigs have "IF" frequencies in the audio range. It would be nice to be able to do DSP up at the front end of the radio, but the sampling rate is too high for currently available technology. Prolly won't be long though. Nyquist had something to say about Cecil's question I think.

Actually, as Jon pointed out, my question was poorly worded. It
is possible to recover the audio modulation on an RF carrier
by sampling at a rate below two times the RF frequency.

Do you realize that it is possible to recover the information by
sampling at a rate lower than 910,000 samples per second? I doubt
that the scoffing technician knows that. The scoffing technician
would probably say that violates the Nyquist principle.

> Second, that same technician would scoff at the simplistic nature of
> your question, in that it displays a basic ignorance of the information
> needed in determining what sampling rate to employ.

It was poorly worded. However, the meaning of the question was not
simplistic. You don't have to sample at 910,000 samples per second
to recover all the information assuming all the information is
riding *on* the carrier and not embedded *in* the carrier.

A source of links to many other sites having tutorials, references, glossaries, etc. is

http://www.eevl.ac.uk

...a UK site maintained by Edinburgh University (?, U of E?). The amateur radio links are handled by a US photographer-ham.

The Carroll-mentioned site is "Integrated Publishing" which has a number of "courses" which are copies of older US Navy instructional textbooks. While good, they can be termed "knock-offs" in the publishing trade since US government info is not copyrighted. Almost everything publicly published by the US government can be scanned, duplicated, published at will. [Case in point is the long-running "J. K. Lasser's Your Income Tax" softbounds that used to be on newsstands...almost entirely a knock-off of free US IRS documents]

The average amateur can better spend their time studying the ARRL or RSGB amateur handbooks, get the same information and considerably more about amateur radio in specifics than someone's copying of a US government tutorial.

In driving around yesterday I saw two vehicles with ham plates,
drivers appearing about thirty-something. The customers at
the Burbank, CA, HRO branch store seem to be under 50 as
a general rule.

In order to find "younger people," one has to get out among
the public, not staying with the "old crowd" (of like-minded
people).

> I don't

So...you feel that the "non-lazy" people have to get out there to
struggle and work like you did? Are you the model of what
everyone "should be?"

I saw Ed Hare's posting of the old Novice Study Guide. Couldn't
be any simpler than that. Seems like the old Novice test itself
was very simple at that time, wasn't it?

Is amateur radio supposed to be all about using CW on HF?

>> > I truly am sorry that times have changed so much, and more's the

>> radio you once did. Perhaps it is not the times that have changed, Dick.
>
>It's the times, Ed. I could be more comfortable with it if I had changed
>more myself.

I went through the same "times" as everyone else and don't see
any of this "dumbing-down" or the "laziness." Everyone should
attempt to adapt to "times" which are constantly changing. The
"times" don't stop for those who give up adapting. The "times" are
not geared for those who think that everything was for them alone.
Why are you so insistent on holding everyone else back to your
standards?

>That little tidbit has absolutely nothing to do with amateur radio. The
>fact that some receivers use a 455 kHz IF might.

On the contrary, with a progression towards digital techniques,
receivers can and do use sampling and subsequent Digital
Signal Processing for both demodulation and "brick-wall"
filtering for the absolute least possible receiving bandwidth.

The normal sampling rate for a 455 KHz IF would be above
the "Nyquist limit" or roughly 2 1/2 times (minimum) rate of
the IF (1.138 MHz, minimum) for an accurate sampling.
That will reproduce the IF accurately enough to permit
digital demodulation.

There are techniques called "undersampling" at rates less
than the IF center frequency but those generally go into
non-standard (even for DSP) techniques which take a lot
more study of that part of technology.

For a good introduction on DSP there is the ARRL Handbook
section on it, written by Jon Bloom. Good stuff, but one has
to buckle down and STUDY it to grasp what is possible.

The ARRL Technical Information center on the League's
website has some very good articles using sampling and
DSP in amateur radio, written by radio amateurs. Free PDF
downloads for members or non-members. [hats off to the

ARRL for that whole website section!]

...or...one can vegetate amidst perceived past glories of
learning things a long time ago and ignore all the
state of the art advances that keep happening...and rely
on the designers and manufacturers to keep turning out
ready-built equipment using new techniques and complain
about front-panel controls that aren't like your old radios.

Jon, what I said was "That little tidbit (of information) has nothing
to do with ham radio". And it doesn't. I didn't say that sampling rates
have nothing to do with ham radio, I said that his little snippet of
information does not.
A case could be made that says anything electronic has something to do
with ham radio, just as one can - and is now being donein several
imnfluential circles- that theory in general has nothing to do with it.

What does THAT mean? I've never before heard a distinction made between information "riding on" a carrier and information "embedded in" a carrier. Can you describe both a "riding on" modulator and an "embedded in" modulator?

Oh, by the way, the sampling rate that satifies Nyquist for your 455-kHz IF is the rate that is twice the bandwidth (not center frequency) of the IF, although practical difficulties may require a somewhat higher rate.

Jon

> digital demodulation.

I'm not sure where the 2-1/2 value comes from. Some rule of thumb, I suppose. But the Nyquist frequency is 2 times the highest frequency present in the signal being sampled. For this hypothetical case of direct sampling (no undersampling) a 455-kHz IF, you would select the IF filter attenuation that reduces the signal to a negligible level (say 90 dB attenuation, just to pick a number), find the frequency of the 90-dB point on the high side of the filter, then double that frequency to find the minimum sampling frequency. That's likely to be below 1.138 MHz unless your IF filter is 200 kHz wide (unlikely for a 455-kHz IF).

But if you have a sampling A/D that can sample at a MHz, you can undersample at a rate at or above 2 times the IF bandwidth (the 90-dB bandwidth, in this case) and save yourself the need to decimate the 1-MHz sampling rate down to something more tractable. There is nothing the least bit tricky about undersampling. One of the first tings I did when I got my first TI DSP evaluation board was to undersample the IF output of my TS-930 and make my own DSP SSB demod.

Actually, they've replaced the chapter I wrote with one written by Doug Smith, KF6DX. Still worth reading, though!

So, you're right, you didn't say sampling rates have nothing to do with ham radio; you said they have nothing to do with *amateur* radio.

Yes, at least any part of electronics that has to with radio communication. That's pretty much my point in a nutshell.

> just as one can - and is now being donein several
> imnfluential circles- that theory in general has nothing to do with it.

I don't think that case can be successfully made. Nor am I familiar with the influential circles where making that case is being attempted. Can you be more specific?

If you are dealing with an IF signal, under sampling is the only practical way to go, couple it with a brick wall filter. This allows a sample rate related to the bandwidth as opposed to frequency.

Fs=0(2BW)<<2F/h

If your interested, I would be glad to post the DSP section of a receiver I have been building.

You never heard of a Z0-match before our email interchange, either.
(I still have a copy of that email.) And if I remember right, I'm
the guy who taught you about the Goertzel algorithm.

Bell 103 is an example of information riding on a carrier.
CCIT V.36 is an example of information embedded in a carrier.

In general, if the BPS rate is less than the frequency of the tone,
the information is riding on the tone, e.g. FSK. In general, if the
BPS rate is higher than the frequency of the tone, the information is
embedded in the tone, e.g. M-ary-QPSK.

One can undersample an average FSK signal and still recover all the
information. I don't believe one can under-sample an M-ary-QPSK signal
and still recover all the information. But I could be wrong since I
haven't looked at this stuff since I retired. (The latest Science News
reports that scientists have figured out how to make water flow uphill. :-)

> Oh, by the way, the sampling rate that satifies Nyquist for your 455-kHz

> IF, although practical difficulties may require a somewhat higher rate.

Depends on the boundary conditions. You cannot closely re-create
the 455 kHz IF frequency waveform unless you honor the Nyquist requirements
for the highest existing frequency and that's usually higher than double
the bandwidth. There are naturally occurring phase shifts in the 455kHz
carrier signal which cannot be duplicated with under-sampling. Like my
original question, you neglected to state your boundary conditions.

I think what you are groping toward is the difference between a signal
that has components down to dc and one that does not. I've never heard
it expressed as "embedded in" or "riding on" a carrier, though, in any
of the engineering texts, reference books, application manuals or
product data sheets I've seen. Can you provide any references for that
usage?

> One can undersample an average FSK signal and still recover all the

> haven't looked at this stuff since I retired. (The latest Science News
> reports that scientists have figured out how to make water flow uphill. :-)

If you can resolve all of the frequency components of the signal without
aliasing you can recover the information. If the frequency components
extend down to dc, you have to sample at twice the highest frequency in
the signal. If the signal is bandlimited around some center frequency,
you can sample at a rate of twice the signal bandwidth. That's true
regardless of the modulation type.

> > Oh, by the way, the sampling rate that satifies Nyquist for your 455-kHz

> for the highest existing frequency and that's usually higher than double
> the bandwidth.

That simply isn't true. A sampled signal is replicated around multiples of the sampling frequency. Thus you can generate a copy of the sampled signal at a frequency many times greater than the sampling frequency. Undersample your 455-kHz signal and then examine the spectrum of the sampled signal. You'll find that the original 455-kHz components are present in the discrete-time signal (along with many replicas at other frequencies). If your sampling rate exceeds twice the bandwidth of the 455-kHz signal, ALL of the original components, undistorted by aliasing, will be present in the sampled signal.

Jon

>
> That simply isn't true.

You're contradicting yourself, Jon. You just admitted above that to get all the components down to zero Hz, you must sample at twice the highest frequency in the signal, i.e. you must honor the 2x Nyquist sampling requirements. In order to "closely re-create" the waveform, one must have *ALL* the components. There's no such thing as a free lunch.

Cecil:

I have no problem understanding the merits of CW. My problem
is with the prospective hams who will no longer be required to learn
it in order to gain maximum HF privileges. I favor the incentive of
the multi-tiered licensing system, including the 3-level code speed
tests, because I believe this is what brought people into the mode.

>would operate at that speed I'll never understand. Selective memory
>perhaps. My first CW QSOs were on my old 2 meter IC 211 - at sub-5WPM
>speed - when I was a Tech.

Jim/Cecil:

Yes, I did make the same 5, 5.5, 5.9, 6.6, 8.2, 10.0 etc. WPM QSO's
as everyone else did. My speed increased incrementally with virtually
each QSO. I also did a lot of practice copying from the W1AW code
bulletins. My progress was swift; I was comfortable at 18 - 22 WPM
within a few months. However, if the maximum testing requirement
stopped at 5 WPM -- then my progress would have stopped there as
well. I was not a motivated and dedicated CW user at the time; that
desire came only with the added proficiency came, and that was
motivated MAINLY by the requirement. I don't think I'm much different
than anyone else in this respect, except that I seem to be more
willing to be truthful about this than the code (test) bashers are.
This is why I believe that in the absence of a "real" code testing
requirement, there will be little or no future growth in the number of
users of the Morse/CW mode. Those who support the elimination of
the requirement, and the re-allocation of Morse/CW spectrum to
phone, know this as well, but can't admit it.

Only if there ARE components down to zero Hz. In the case of your
455-kHz signal, no signal components exist below the low end of the IF
bandwidth. That's why we can use harmonic sampling.

> In order
> to "closely re-create" the waveform, one must have *ALL* the components. There's
> no such thing as a free lunch.

Yep, but "all the compoments" exist in a small band of frequencies, not
a band 455-kHz wide, and that bandwidth can be sampled and
reconstructed, according to Nyquist, using a sampling rate twice the
bandwidth.

Jon

Well, hoopty lolly doo! You got a 706 with the *audio* dsp! I've had a series of those in the past several years and have yet to find any working advantage in any of them. The one on the IC756 stays turned off, I haven't yet found any situation where I can say it is helpful to the point that I would have paid what it cost to build it into the rig.

Any Extra who doesn't want to understand
> sampling rates chooses not to understand modern day ham radio. You are

So what's your problem? I do understand the basics of DSP sampling and have no desire nor intention of designing one for myself - I am not a digital designer and have no intent to ever become one. That I'llleaveto you who profess to be digital engineers. Since I'm not an engineer and you are, you slam me because I'm not, while your status as an engineet doesn't make you any better a ham. Fact. You're just a better digital designer. That's the way it is.

As time moves on and progress

Really? Sometimes, in the case of a DSP adapter to work off of
an existing receiver that has a 455 KHz IF, there isn't any choice.

Please examine the IFs of existing cellular telephones and
see what those Intermediate Frequencies are...rather higher
than 455 KHz these days.

>your question, in that it displays a basic ignorance of the information
>needed in determining what sampling rate to employ.

Now, now, let's not get testy here... :-)

Going back over three decades to the appearance of the first
sampling oscilloscopes, those all used undersampling (using
today's terminology for yesterday's accomplished art)...i.e.,
the sampling rate was wayyyy slower than the rate of the
RF being sampled.

>suppose.

Yes, pre-IC times. The old GE 24-voice-channel microwave radio
relay terminal used pulse-position modulation converted after
detection to pulse-width modulation. At about 8 KHz pulse
repetition rate, the modulated pulse width was tossed into a
3 KHz low-pass filter to recover the modulation audio. 1950
production stuff with tubes. Army version was AN/FRC-23.

>unless your IF filter is 200 kHz wide (unlikely for a 455-kHz IF).

Yes, I'll agree that the Nyquist minimum has to hold for a
maximum modulation frequency. :-)

[If one isn't used to it, trying to "see" the process through the math
isn't a trivial task when working from the original Carson (?)
modulation equations]

Minimum signal level would be dependent on the A-to-D of the
sampler. Nowadays a 16-bit A-to-D at 0.5 MHz sample rate
is not an unreasonable requirement...the least-significant bit of the
sampled digital signal voltage would be about -96 dbc.

>But if you have a sampling A/D that can sample at a MHz, you can
>undersample at a rate at or above 2 times the IF bandwidth (the 90-dB

>1-MHz sampling rate down to something more tractable. There is nothing
>the least bit tricky about undersampling. One of the first tings I did

>when I got my first TI DSP evaluation board was to undersample the IF
>output of my TS-930 and make my own DSP SSB demod.

Sounds interesting and would be good material for an article
somewhere?

Older sampling oscilloscopes were ALWAYS running in an
undersampling mode...as were the undersampled PLL-ed
microwave frequency sources...around mid 1960s for the
first of them. I still have a problem with aliasing on the
analysis, though. [personal analysis work, used both, no
problem, specified and bought the sources for a couple
contracts]

Might be a picky detail here, but the sampler aperture time
has to be quite a bit shorter than the sampled signal period.
[got that impression when I saw an 8 GHz sinewave being
sampled at the H-P display at a 60's WESCON...:-)]

If the sampler can't hold the signal after sampling due to way
longer sampling, then a second sampler has to be used to
keep the sample charge long enough for the A-to-D to convert.
[in the old sample-and-hold input circuits, at least...]

There's still an aliasing problem if the sampling is too close
to an integral number of either the RF or the modulation
frequency, yes? Remind me if not, please...haven't gone
deep into undersampling hardware-software.

tRoll;

The FCC grants US amateur radio licenses. THEIR requirements insofar as licensing is concerned is what counts.

The FCC has already said (1990 and 1999) that it doesn't think a morse code test is significant for THEIR licensing criterion in US amateur radio. They also stated that the only reason one is necessary is the ITU-R standard S25.5.

Neither you nor I nor anyone else in here can know the future with any certainty. Morse code may achieve a great popularity in the future...or languish into disuse...or simply go on as it does now...or none of those.

There is NO technical reason for the retention of a code test, no administrative reason on the part of the FCC. All that remains is some artificial-emotional standard of some individuals that a "code test is necessary to prove something."

The FCC doesn't think a code test "proves" anything to them for the purposes of granting a US amateur radio license. The FCC has said so...twice in a decade.

> 73, Jim AC6XG

With all due respect, I am not talking about your feelings Jim. I am
speaking about what is required so that FUTURE Hams can regain the
PRIDE that the hobby once had. A certificate that says that you worked
all states, all zones or a hundred nations may be wallpaper BUT a
license that says that you passed really comprehensive technical exams
can restore the kind of pride that once had value to academic,
commercial and military establishments. Such a license could command
real respect, not for just individual hams, but for Ham Radio as the
technical educational hobby that it once was and should be. To do so
there has to be a lot of technical catching up for the Hams who want to
have the pride of being known as Ham Experts.

Yes...
Hams need MORE license classes and/or official FCC endorsements so that
they can show [by certification] that at least some of them have the
potential of being radio communications experts.

73,
Bob Wex w2ilp (Insure License Potential)

I know of no safe depository of the ultimate
powers of society but the people themselves;
and if we think them not enlightened enough
to exercise their control with a wholesome

discretion, the remedy is not to take it
from them, but to inform their discretion
by education. This is the true corrective
of abuses of constitutional power.
--Thomas Jefferson(1820)--

Ham Radio can only be saved by Hams themselves.
The FCC may take away their frequency bands if
they are unable to prove that they are
potentially able to meet the goals as outlined
in the BASIS and PURPOSE of Part 97. The
only protective action is accountable ham
education. Ham education is being abused by
those who are unwilling and unable to modernize it.

Mine performs miracles. The point is that DSP, both audio and at RF
frequencies, is an expanding part of ham radio. If you refuse to learn
about DSP, you will become even more ignorant than the newcomers.

> So what's your problem? I do understand the basics of DSP sampling and

The point is that as time moves on and designs progress, ham radios will
become more and more digital until you will be totally ignorant. You will
be like the hams who refused to learn anything about SSB in the 50s.

Larry is a little more than just "upset." For many months, Larry
has carried on an endless campaign to belittle newly licensed
operators with the use of derogotary names and insulting
characterizations, while endlessly denigrating their efforts and contributions.

Those newly licensed operators include my wife, myself, and the many
thousands of other decent people whose only ham radio "sin" is that we
didn't obtain our license in the same manner as Larry.

Now, I'm sorry if Larry does not like how I obtained my license, but
he is a damn fool if he thinks I'm going to give it up just because it
makes him "upset." And he is equally a fool if he thinks we're going
to feel sorry for him because he is "upset" about the reduced code requirements.

In the end, Larry needs to grow up and get over his relentless
self-pity. If he isn't able to do that, then Ed is absolutely right -
Larry needs to give up his license and move on to something else that
does not "upset" him so much.

To my knowledge, Ed has never presented himself as a representative of ARRL in these newsgroups (ARRL doesn't have any representatives in this newsgroup that I'm aware of). In fact, if you had not mentioned it, I'm sure most people would have never even known about his involvement with ARRL.

But, whatever the case, I have never considered any comment made by anyone in this newsgroup to be representative of the views, opinions, or official policy, of that person's employer (or group affiliations) unless it is obviously so.

To do otherwise would have a chilling effect on free speech in these newsgroups.

True...but as engineers, scientists or medical people the
MECHANISM...chemical, biological, electral, mechanical or whatever must
be understood if there is to be any corrective measures devised. No
logical standards can be concluded without an understanding of the real
cause.
A hot chicken does not tell you the mechanism by which it got hot...but
if you heated it in your microwave oven..You know the mechanism was
microwave RF not heat conducted from a gas burner or radiated by your
fireplace.

> Which makes sense. For the purpose of determining safe levels,

NOW YOU ARE NOT READING MY POSTS. Everyone who uses a cell-phone is
being volunteered [unknown to themselves] as a test subject. The
people who developed cancerous eye conditions were frequent cell-phone
users and were counted in statistical studies, which can scientifically
prove the high probability that the MECHANISM for causing the cancers
was cell-phone RF.

It is also interesting to note that for many years tobacco was not seen as a health hazard...but once the mechanism [cigarette tars] was studied lots of different diseases were found to be caused or accelerated by excessive smoking.

Yet there are smokers who live to be 100 years old, who seem to be able to physically resist the hazardous mechanism(s). Is cigarette smoking safe? NO. Not for average people.

> is playing the bigger role in forming your opinion.

Yep but I have been given no grants and no cash incentives to prove the safety of either cell-phones or Ham HTs. What predjudice? I am not in power to make any
decisions...only observations of scientifically proven facts made by

others who can gather the statistical evidence and/or can perform lab experimentation. Some experimentation is being done on living cells in test tubes rather than human bodies. It can help to prove the MECHANISM. I say that UHF and microwave frequencies are a greater hazard than VHF. Why?
Because the possibility of heating human tissue or interfering with its normal biological functions is there...That is the MECHANISM! True, I have not quantified...but researchers are in the process of doing so. RF from an antenna in the near field is usually hard to evaluate. At UHF and above there can be concentrated beams of in-phase energy developed. Thus even at low RF power output, there can be dense narrow beams of RF developed. This effect is less at VHF than UHF and above. I don't claim to know all the details of cause and effect...but I also knew not to walk on thin ice before I learned basic thermodynamics.

The human body has developed various ways to protect itself from strong sunlight radiation...because there has always been a Sun; longer than there has been humans. We can not see RF or biologically protect ourselves from its hazardous radiation without technical intervention, as well as we have evolved to protect ourselves from strong sunlight. Strong spectral density RF has not been around long enough for the human body to adopt itself to its dangers. We can not afford to let people suffer and die from RF radiation until the survivors can develop protective immunity to it.

Please keep thinking,

Yes, although if the receiver AGC loop is separate from the DSP, that's probably overkill, and if the DSP is within the AGC loop it's probably not enough.

[Re: unsersampling]
> Might be a picky detail here, but the sampler aperture time

I don't think it's a picky detail at all. It's a pretty fundamental point and is what's hard about making high-speed sampling A/Ds.

> There's still an aliasing problem if the sampling is too close
> to an integral number of either the RF or the modulation
> frequency, yes? Remind me if not, please...haven't gone
> deep into undersampling hardware-software.

The concern is with a harmonic of the sampling rate falling within the band of signals being sampled. That was the main practical consideration I was referring to when I said you would probably want to use a sampling rate somewhat greater than Nyquist demands. You don't want a multiple of the sampling rate to appear within the band you're trying to sample because it makes things more complicated; you have to convert the signal to an analytic signal and then (mathematically) frequency shift it. It's just a whole lot easier if you choose a sampling rate for which no multiple appears in the band of interest.

Jon

Nope. As long as the sidebands produced by your phase modulation fall
within the IF passband, they'll be present in the sampled signal.

Dave,

It is pretty high. I joind the ARRL in 1964 for $5.00 a year. Using the
CPI index from 1964 through 2000 that $5.00 is now worth about $27.50.
The ARRL is over 40% higher with the news dues rate. As some have
mentioned, services that were once without additional cost to members
now carry fees. I probably should have gotten life membership back
then.

But we can't apply corrective measures to the design of the human body.
The only factor we can control is how much RF we expose ourselves to.
For that purpose, it is the effect of the exposure that is important,
not the underlying mechanism.

> A hot chicken does not tell you the mechanism by which it got hot...but
> if you heated it in your microwave oven..You know the mechanism was
> microwave RF not heat conducted from a gas burner or radiated by your
> fireplace.

But if the point is to cook a chicken I don't need to know the mechanism
by which the cooking takes place, I only need to know that it gets
cooked when I apply either heat or RF at sufficient levels.

It's nothing like that at all. We need to know Ohm's law so we can
design electrical devices. We're not designing human bodies. (Although
there are those doctors who've announced plans to clone humans, so maybe
we will be designing humans soon!)

If you choose a different base year, you get a different result. Neither the CPI nor ARRL dues increase in a smooth, continuous curve. Plus, of course, the CPI measures the costs of a lot of things that aren't relevant to ARRL's costs of providing services and doesn't measure the costs of a lot of things that are relevant, like the cost of magazine paper and mailing costs.

I don't think it was available in '64, was it? Seems to me it was a few years after that when it became available.

I would suggest you look up the price of haircuts or any other personal service. The CPI is of less than phenomenal value for any analysis but any index will show that wherever the good or service in question uses people rather than capital it will rise faster than the index as a whole.

Look at your school taxes where the only two technological innovations in a thousand years have been central heating so we don't wear robes anymore and a fellow named Gutenburg making it unnecessary to chain the prof's notes to the lectern. Now there is a personal service business!

Of course, but that doesn't resemble my statement. I have hypothetically added unknown modulation components to an IF frequency signal *after* it has been passbanded as a test for your undersampling techniques. How well can you do?

If the sidebands fall within the passband it doesn't matter whether they were created before or after bandpass filtering. If they fall outside the passband, you've created a new passband and an appropriate sampling rate for that passband must then be chosen in accordance with the Nyquist criterion of twice the bandwidth.

I do believe that is exactly what I said, Jon, and you argued with me. So
I repeat: If one doesn't know the passband and wants to guarantee that all
possible modulation components are decoded, one cannot use undersampling.

No, this is the first time you specified an unrestricted passband.

Your explanation of why there needs to be more ham licenses reminds me of Nigel Tufnel explaning why his amp goes to eleven. I'm afraid that if you want to command respect from anybody, you'll have to do more than wave a license at them anyway. Besides, I don't think the FCC intends commanding respect as being the basis and purpose of the ARS or of licensing. It's a lovely dream nevertheless.

Right. And this incremental increase in speed had nothing to do with FCC rules. It occurs inevitably to almost everyone who uses CW. Personally, I don't care how fast someone can copy code if they never get on the air and communicate with it.

> However, if the maximum testing requirement
> stopped at 5 WPM -- then my progress would have stopped there as

> willing to be truthful about this than the code (test) bashers are.

The point is that 5 WPM is indeed sufficient for someone to get on the air, use the code, and increase their proficiency - contrary to your claim. If they're not going to get on the air in the CW mode, then they don't need the increased proficiency and no one, not the ARS or the FCC, benefits from their increased proficiency. In my opinion, only the ham himself benefits from it, and again, only if he uses it.

I think some form of code requirement is still worth keeping - even if it's in the form of multiple choice dits and dahs on the written exam.

> This is why I believe that in the absence of a "real" code testing

Spectrum allocations are a whole different ball of wax. Personally, I don't see the use of phone in the Novice CW portions of the band as much of a threat to CW. I can sure as heck filter out phone with my CW filter a lot better than I can filter out CW with my phone filter.

Hi. I came across this thread in a microwave search.

I have a PDF copy of a comment I submitted to NTIA recently: It
attempts to clarify the mechanisms involved, which seem to have
been misunderstood by many past researchers.

It is somewhat technical, but the main point should not be
difficult.

Email me at jwill@AstraGate.net for a copy.

If after reading it, you think it worthwhile and
know of a web site, I'd like to post it somewhere.

Agreed. But they have, as you note, been remarkably
silent as to what, if anything other than proficiency of code
is proven by the requirement. Smetimes the silence can
be deafening.

>They

Do you have even the slightest belief that the FCC has
any inclination to retain code once but for the current
international requirement (S25.5)?

That could be, but it sure does nothing to indicate to anyone that any other ham needs to have that level of training in DSP or they should be considered as "ignborant". Rather, anyone who would make such a statement is himself ignorant.

I just looked up "pride" in the Bible concordance. Wow, God sure
doesn't like pride. He prefers humility.

Here's the interchange. Note that I didn't say anything about any passband.
It is clear that I am talking about taking the IF signal after the filter
and modifying it so that your undersampling technique won't work. What is
it about "at the IF frequency" that you don't understand?

> Cecil said:
> > I can phase modulate at the IF frequency and

Jon replied:
> Nope.

So are you going to continue to assert that your undersampling technique
will work no matter how much extra modulation is added to a signal or are
you willing to change that "Nope" above to "Yes, but ..."?

I'm telling you, Dick, if you don't learn DSP techniques, you are going
to be a technically obsolete/ignorant ham in the not too distant future.
All filtering and detection functions will soon be done with DSP.

Firecracker Material (courtesy of AH0A statistics on US ham licenses)-

In the 9 months following US amateur radio restructuring, the total number of US amateur radio licenses increased by 3,701 (+0.55% of total). Code-tested licensees declined by 9,531 while non-code-tested licensees increased by 13,132.

In the 3 years from January 1998 to December 2000, the total number of US amateur radio licenses increased by 5,734 (+0.85% of total). Code-tested licensees declined by 33,267 while non-code-tested licensees increased by 39,001.

It should be fairly obvious that the non-code-tested are continuing to increase in number just enough to offset the decline in code-tested licensees plus a slight positive growth in total ARS licensees...but not a significant growth. The code-tested licensees have continued to decline despite various rationales on that seeming "inaccuracy"...an "inaccuracy" claim that will probably continue until the last code-tested licensee is SK.

As of the end of December 1997, code-tested licensees were 73.4% of the total, non-code-tested licensees were 26.6% of the total.

By the end of December 2000, code-tested licensees were 67.9% of the total, non-code-tested licensees were 32.1% of the total.

The balance scales keep tilting in favor of the non-code-tested license classes.

As far a NEW amateur radio licensees is concerned, it very obvious that newcomers are favoring the no-code-test Technician class despite the lack of operating privileges below 30 MHz. In three one-year periods (Jan to Dec) from 1998 to 2000, the numbers are -
2000:
Total new licensees: 18,658
Code-tested new: 1,768
Non-code-tested new: 16,800

1999:
Total new licensees: 16,311
Code-tested new: 2,355
Non-code-tested new: 13,946

1998:
Total new licensees: 17,521
Code-tested new: 2,745
Non-code-tested new: 14,776

While some claim that Technician Expirations are just starting and are supposed to show "signigicant decreases" in that class, such speculations ignore the continuation of new Tech licensees that show no indication of slowing down the Tech growth rate. That supposed "entry level" class is very nearly one-third of all US licensees.

>there. (I'm talking about your brain.)

...this is getting to be just finger-pointing and shouting.

Cecil, demonstrate however you can with SPECIFICs, please, how
you can add modulation components to an undersampled signal
that cannot be detected. No word play, please, electrons and
waves don't respond to human word play.

Let's refer to a sampling oscilloscope. Does a sampling scope
accurately portray a waveform having a much shorter period than
its sampling period? As far as I've seen in theory and in practice
it does.

The output of a sampler frequency-shifts a waveform down in
frequency. The waveform in the time-domain contains all the
components of the frequency domain, amplitudes, phases, the
whole thing. Demodulation of a frequency-shifted modulated
RF signal is done by the same method as demodulation at the
original frequency.

If you are "adding something (unspecified)" to an undersampled
signal that "cannot be detected," then you have to start naming
these unspecified conditions to prove your point. Without those
particulars your message point cannot be detected.

>
>They said that it doesn't prove anything about character. They never said
>it doesn't prove "anything". Obviously it proves code proficiency. They
>have more of a neutral bias on the issue than you do, I think..

As far as what I've been able to read in 1990 and in 1999, the FCC
said that the amateur radio code test does not prove anything for
their purposes of granting a US amateur radio license. [please to
include the whole sentence I wrote in quoting]

Can you say the only US civil radio regulatory agency has a "bias"
on what they grant? Said "bias" is a very subjective thing for every
observer. The FCC simply regulates US civil radio and issues
licenses where regulations call for them.

Yes, the code test proves some elementary code cognition
ability. Is that the whole point of US amateur radio below 30
MHz? To prove some code capability?

Is obtaining a code-tested US amateur radio license all about
"proving one's worth to the 'amateur community?'" I don't think
so looking at it from the FCC's point of view. The US amateur
radio community doesn't issue licenses nor does it "grade" any
licensee...officially.

As of December 1997, the number of code-tested US amateurs
was 73.39% of the total licensees while the number of US
amateurs not code tested was 26.61% of the total.

As of December 2000, the number of code-tested US amateurs
was 67.9% of the total, the number of non-code-tested US
amateurs was 32.1%. In actual numbers of amateur licensees,
the number of code-tested amateurs is dropping while the
number of non-code-tested amateurs is rising. It's been that
way for several years. The FCC can see that rather well.

Is the FCC "neutral" on amateur code testing? I don't think so.
If they were "neutral" they wouldn't have made the statements

they did in 1990 and 1999 R&Os about code tests...probably
wouldn't have even bothered to create the Technician class.

Falling into the desperate habit of resorting to selective quotes to twist meaning, again, eh? Let's review the *complete* quote:

Jon replied:
> Nope. As long as the sidebands produced by your phase modulation fall
> within the IF passband, they'll be present in the sampled signal.

Clearly, it was only after you read that that you tumbled to the way it actually works. Now, of course, you are trying to reinterpret your earlier statements to mean something other than what you said. Your usual scramble when you've been shown to be wrong.

> So are you going to continue to assert that your undersampling technique
> will work no matter how much extra modulation is added to a signal or are
> you willing to change that "Nope" above to "Yes, but ..."?

Since I never asserted that, as the *complete* quote above shows, it would be impossible to "continue." (See: "Have you stopped beating your wife?") You just can't stand to admit you were wrong about something. But I think I've derived enough amusement from watching you squirm. Feel free to have the last word.

Jon

NO!!! Maybe *most* newly manufactured SSB and some other gear
will incorporate DSP functions. Not homebrew nor kitted gear which is
becoming so popular with so many hams these days. Your statement is
simply untrue. Stop trying to remake the ARS to your own personal
specifications.

Please don't try to divert the subject from what you said that was wrong
to what you said that was right. We are not discussing the truisms that
you uttered. We are discussing your assertion that I cannot add modulation
components to a signal that your undersampling techniques cannot detect.
I said I could. You said "Nope", I can't. That "Nope" is all that matters.

You seem to be continuing to assert that I cannot add modulation components
to a signal that your undersampling techniques cannot detect and you are
coming across as a person who considers himself so perfect that he never
makes a mistake. You obviously made a mistake, Jon, which can be diagnosed
by answering the following questions, true or false.

1. Cecil cannot add modulation components to a signal that cannot be
detected by my, Jon's undersampling techniques. (true or false)
If you answer true, you are mistaken. If you answer false, you
contradict your previous "Nope" assertion.

2. I, Jon made a mistake in my inference about what Cecil had said.
(true or false)

One of the above above two things happened, Jon, and either way, you
made a mistake. Sorry, you are going to have to give up your "Mr.
Perfect" posture.

> Since I never asserted that, as the *complete* quote above shows, it
> would be impossible to "continue."

It doesn't matter what you said after "Nope", Jon. The "Nope" was the part that was wrong. If I say "A=A" and you say "Nope, B=B" you are still wrong. And you are still wrong. To correct your mistake you must change "Nope" to "Yes but ..." because you know and I know that I can add modulation components to a signal that your undersampling techniques cannot detect. How you can deny saying something that is still there in the thread for all to see is unbelievable.

Now you've got me curious: How do you plan on going into Jon's radio
after the IF sampling has taken place to "slip an undetected message
right past your undersampling techniqjue"? Anything that appears at the
point the undersampling takes place will be sampled at an equal rate.
Are you into magic these days? Or just excessive grape juice?

Ed:

I'll keep my amateur radio license as long as it serves me in any manner I find useful. I do admit that my enjoyment of ham radio is greatly diminished along with the reduction in licensing standards. I seem to have worked everyone there is to work on CW, and even on the FISTS frequencies, there is nothing there but mindless awards-chasing and 84-year-old retirees in Florida trailer parks, running their letters and words together but doing it very fast, indeed. I doubt that even if large numbers of new hams come on the air in the Post-Restructuring era, as they have yet to do, that my interest will be rekindled very easily. I had high hopes and aspirations as a ham; but I now find myself strangely apathetic. I really would like to get the old ham spirit back, but that hasn't happened. I was having fun on PSK31 for a while, but once I worked seemingly everyone using that mode, and they were also 84-year-old retirees in Florida, there was no more point in it.

I'm not quite ready to give up on ham radio yet, Ed, but the ARRL, now that it's talking about trying to save a bit of CW spectrum for future use, has really put a damper on my former enthusiasm. I also see the handwriting on the wall. Our vast spectrum, especially above 500 MHz, is way to valuable to future wireless service providers for us not to lose it in vast chunks in the near future. Therefore, the future of ham radio for me may very well be to use these services on *former* amateur frequencies. Time will tell, but for now, my license stays on the wall of my "shack."

Jim:

I don't think Fred was referring to chronological age; he was referring
to hams who have been licensed for longer periods of time. Just what
period of time he considers an "older" ham to be is anyone's guess, but
I'll attempt to quantify it by stating that anyone licensed prior to the
implementation of VE-testing, as I was, is an "older" ham. The VE-testing
was the beginning of the end, dumbing-down wise, IMHO. Ironically,
I originally supported the concept of VE testing, and upgraded rapidly
with the notion of a lengthy career serving the hobby as a VE. Then
the corruption reared its ugly head, and I washed my hands of the VE
mess while I was still relatively uninvolved. I digress. An "older" ham
is one who was licensed as a General or above prior to 1985. Since
I was originally licensed in '81 and attained Extra class in '83, I meet
my own definition as an "older" ham, regardless of my age.

Your mileage may vary.

>comtemptible. That has nothing to do with one's opinion of the value of
>code testing.

Jon:

What is truly contemptible is the raw laziness of those who ragged on and on ad infinitum about the uselessness of the code testing requirements, using the same specious arguments about how it was inhibiting the development of modern digital technology and keeping young people out of ham radio. What is equally contemptible is how the ARRL reversed its course on the support of code testing, the minute they saw a requisition for red ink from their accounting department. What is contemptible is the sappy, saccharine political correctness of ARRL officials who never saw a knuckle-dragging HT user they didn't fall in love with -- all the while staring directly at their wallets. What is truly contemptible is the way amateur radio no longer stands for any kind of meaningful accomplishments. Heck, learning isn't even required anymore, since the licensing requirements have been dumbed-down to insignificance. What is truly contemptible is how the National Association for Amateur Radio has found it necessary to insult the collective intelligence of both past, present, and future hams at the same time. Believe me, Jon -- when it comes to contemptible things, you ARRL guys know what you're talking about!

Personally, I have complete contempt for what ham radio has turned into. And, as the "National Association for Amateur Radio," I can't see anyone to blame but the ARRL. The way I see it, you (the ARRL) could have stopped Restructuring and supported, defended, and successfully retained the status quo in amateur radio license testing. You went for change for change's sake, only because the slouchers demanded it. Now, you get to lie in the bed you made.

If I read the statistics on the Speroni web site correctly, there has been a net gain of 4,063 licensed amateurs since Restructuring took place in April, '00. How many new ARRL memberships have been taken since then?

>
>I can tell from personal experience that Code Quick works. Because it
>takes the drudgery (memorization of dits and dahs, listening to CW and
>waiting for divine inspiration, etc.) out of learning CW, it seems that
>everyone who tries Code Quick sticks to it. You CANNOT say the same
>about other methods.

Jason:

There are plenty of better methods. Simply learning the characters
and getting on-the-air at 5 WPM is the best way to go. However,
Code Quick makes a disasterous short-cut, by employing cutsey
sound-alike phonetic phrases that require double or triple
translation in the brain before the act of writing down a letter takes
place. So, you're listening to "dadidadit" and you've got to think
to yourself "that was 'dadidadit' so that sounds like 'Debbie did it'
or something like that, and 'Debbie' starts with a 'd' so I'll write
that down. Of course, the character sent was a "C," but who's
counting? I think Code Quick is the most confusing, inhibiting,
and inefficient Morse code learning programs ever devised. The
attraction is certainly unmistakable, for it offers the proverbial
free lunch -- and therefore, gets a strong following from the
clients of the ham radio Welfare State.

>I challenge you to find anyone who tried Code Quick but failed.

Well, all I can say is, I know a lot of people who own the tapes,
but none of them are regular CW users!

>I will agree with you that Code Quick alone isn't enough for 20+ wpm.

Damn straight! It practically wires your brain in a way that makes
it impossible to get beyond 10 WPM. But, in these days of a 5 WPM
maximum code test, I guess that's no longer a problem.

>Well, at some point, the Code Quick user has to start copying in
>his/her head. But at least there's nothing to unlearn.

Nothing but everything Code Quick taught them about character recognition! You see, Code Quick users didn't learn to react directly to the sound of a Morse code character -- they have to do the "translation" sequence in their mind before the light comes on and the write down the character.

>Larry, you obviously do NOT need Code Quick.

No, thank God, I don't! Oh, speaking of God, that's another problem I have with Code Quick. It indulges in religious proselytizing right in the middle of the tape. Specifically, fundamentalist Christian proselytizing. Why is religion brought into the program? What about potential customers who are Catholic, Jewish, Muslim, or any other non-fundamentalist Christian religion? If the guy wants to sell religious tapes, he should do so within the confines of that market -- and not include HIS specific religious beliefs in a program marketed to people from all walks of life who are interested in ham radio. Is there any disclaimer on the tape package? I've never seen any!

>But the "lazy No Code" crowd certainly does.

Well, I give you Brownie points for at least admitting that.

Show me someone from this group, and I'll show
>you someone who didn't use Code Quick.

Like I said before, I know a lot of people who own Code Quick -- but virtually none of them went on to be proficient CW users. They may have passed their code tests, but they didn't gain the skill. I'll stick with what works -- learning the sound of the individual characters using the Farnsworth method, and getting 2-way practice on-the-air.

We know that, Larry. But the only thing that has changed about ham radio is that the artificial pecking order of license classes has been deemphasized. Ham radio is still what its participants make of it. You still have authorization to use a wide variety of signal types and operating techniques on a wide selection of frequency bands. There still are many people interested in that wide variety of activities with whom to consort. If part of what you derived from ham radio was the I'm-better-than-them ego boost provided by your position in the license structure, ham radio's benefit to you has indeed been diminished. That frankly doesn't concern me since ego boosting isn't the purpose of ham radio.

Dwight:

Hmmm. Just what *are* the "contributions" of these newly
licensed hams you're talking about? Specifics, please -- include
any relevant documentation -- news articles, media releases,
etc.

> Those newly licensed operators include my wife, myself, and the many
>thousands of other decent people whose only ham radio "sin" is that we
>didn't obtain our license in the same manner as Larry.

Hmmmmm again. Just where did I state that "newly licensed operators"
were not "decent people?" Please provide quotes from Deja.com.

> Now, I'm sorry if Larry does not like how I obtained my license,

I could care less how you obtained your license, Dwight.

but
>he is a damn fool if he thinks I'm going to give it up just because it
>makes him "upset."

The way you obtained your license does not make me upset and I
wouldn't dream of asking you to give it up. You struggled and
suffered through those not quite insurmountable licensing requirements,
and I feel you've earned your place in today's ARS. You can be duly
proud of your astounding achievement, in light of present day standards
and expectations. If you were here right now, I'd pat you on the back!

>And he is equally a fool if he thinks we're going
>to feel sorry for him because he is "upset" about the reduced code
>requirements.

Again, I am not "upset." The code requirements were there for me
to achieve, and the fact that they are no longer standing in YOUR
way makes me happy for you! I got to prove something to myself
and others through the application of diligent effort -- and you didn't
have to! Everything worked out well for both of us.

> In the end, Larry needs to grow up and get over his relentless
>self-pity.

Please stop looking in that mirrow while you're talking about me,
Dwight. Its confusing.

>If he isn't able to do that, then Ed is absolutely right -
>Larry needs to give up his license and move on to something else that
>does not "upset" him so much.

No upset here, Dwight. I'm fine. Wish the same were true of you!

Jon:

I guess you're more affected by such things because I was never personally aware of this "pecking order," nor was I ever negatively affected by it. Now, that's easy for me to say, because in my own case, I wasn't exposed to it very long, due to the relative simplicity of rising to the top of the so-called "pecing order." What I could never understand is why those people who WERE sensitive to the "pecking order" never bothered to apply themselves to overcoming it, or at least rise to the top so they could be the "peckers" rather than the "peckees," if they preferred. But, you know, this "pecking order" stuff is just exactly the kind of whining that was a big part of the dumbing down-process, and it doesn't surprise me to see that an ARRL staffer, in the prototypically smug, smart-assed, bad attitude manner that a lot of hams have learned to expect from ARRL HQ officials, is now writing about it. I suggest you put in Op-Ed piece in QST about how much better ham radio is now that the "pecking order" has been removed. Be sure to include the words of "Kumbya."

>If part of what you derived from ham radio was the
>I'm-better-than-them ego boost provided by your position in the license

You may not have given it much thought, but you've been practicing it by
pecking at those who you perceive to be lesser hams than yourself, based
solely on what license they hold, and by insisting that the removal of
the pecking order has turned ham radio ito something contemptible.

> >That
> >frankly doesn't concern me since ego boosting isn't the purpose of ham

That concept is still present. It just doesn't require government
validation any more. We don't need government proclamation of who is and
who is not a "real" ham. We can recognize and celebrate real achievement
(as distinct from passing exams) within the amateur community -- and
without denigrating those who choose not to pursue a particular subset
of ham radio.

> Jon

Jon,

I really do not know if it was available then, but the yearly membership of $5.00 for me was two weeks allowance and seemed very reasonable at the time. While you are correct about the base year selection, one needs to start somewhere. I have always thought that the CPI actually understated the real overall cost increases that most families notice over a long period.

It is easy to get pricing from any time period and there are some things that have come down in terms of the CPI. Some examples are electronics (huge drops) many grocery items, gasoline (but it is now catching up) and some major appliances. However, other costs affecting families have shot up much faster than the CPI. Costs of vehicles, housing, many kinds of insurance except for possibly life insurance, health care, college tuition, lately heating oil and natural gas, and as some have mentioned, personal services.

The problem with the CPI is that it probably not weighted correctly, but it is the index that many things are tied to such as social security and some contract wage increases. It is also the prime indicator of inflation and can be the generator of federal reserve interest hikes or cuts that have tremendous impact on the overall economy.

I tend to look at most pricing in terms of the CPI starting at some base period, usually when I began to purchase items of the same category that I purchase today.

Richard,

Good Point, Especially on the school taxes. There are reasons of course. In our local school system the addition of system personnel over the last 10 years has been tremendous while student population has declined about 18%. Computers cost money, as does new sports facilities.

>>comtemptible. That has nothing to do with one's opinion of the value of
>>code testing.
>
>Jon:
>
>What is truly contemptible is the raw laziness of those who ragged
>on and on ad infinitum about the uselessness of the code testing
>requirements, using the same specious arguments about how it
>was inhibiting the development of modern digital technology and
>keeping young people out of ham radio.

Mother Superior;

US amateur radio is surviving just fine and attracting newcomers.
But...NOT through code testing for a license. Attrition is
happening, has been happening among the code-tested
licensees. See the statistics compiled from FCC public data
by a supporter of morse code, AH0A.

>What is equally contemptible
>is how the ARRL reversed its course on the support of code testing,
>the minute they saw a requisition for red ink from their accounting
>department.

tRoll, the ARRL quite rightly supports amateur radio regulations
as being the law for US amateurs. How do you manage to
make obeyance of law as contemptible? Are you an outlaw?

>What is contemptible is the sappy, saccharine
>political correctness of ARRL officials who never saw a knuckle-
>dragging HT user they didn't fall in love with -- all the while staring
>directly at their wallets.

Truly a Troll statement. No-code-test Technicians are very close
to one-third of all US amateur radio licensees yet the ARRL
membership demographics indicate that only about one-eighth
are ARRL members. How is it "comtemptible" for the ARRL
to encourage Technician class memberships?

Isn't it contemptible for the tRoll to label Technicians as
"knuckle-dragging HT users?" See past references to them
as "shack on a belt" amateurs.

> What is truly contemptible is the way
>amateur radio no longer stands for any kind of meaningful
>accomplishments.

Ah, so the tRoll does not see therefore these accomplishments
do not exist.

Digital Signal Processing (DSP) has existed for two decades
in electronics...as ready-built hardware, as kits, as computer
programs controlling computer sound cards for audio processing.
Has the tRoll done anything with that technology other than
reading sales ads on them?

If the Holy tRoller would look into past issues of QST or QEX or
even the Technical Information Service page of the ARRL he
would see a number of technical accomplishments by radio
amateurs...accomplishments that the Holy tRoll could duplicate
if he wasn't so busy sneering at no-coders.

>Heck, learning isn't even required anymore,
>since the licensing requirements have been dumbed-down to
>insignificance.

Mother Superior role again. No one knew as much at the time
of license testing as the Holy tRoll. Apparently all that was
forgotten afterwards since the tRoll does not participate in any
discussion involving technological arts.

Mother wishes everything to be static, set in the armor-plated
concrete of past standards and practices, no advancement for
the Mother cannot learn anything after being licensed long ago.

>Personally, I have complete contempt for what ham radio has turned
>into.

Then you should turn in your license, declare it null and void,
quit, go QRT, forget about it. With one less of your kind around
it would be more attractive to newcomers.

Apparently Mother Superior wishes to be honored and revered
for claimed accomplishments above and beyond human ken.
No doubt she feels truly superior, perhaps god-like in majesty,
the law-giver who sits in judgement of "lesser beings." :-)

>... The way I see it, you (the ARRL)
>could have stopped Restructuring and supported, defended, and
>successfully retained the status quo in amateur radio license testing.

The ARRL did, according to public record, support and defend
a virtual status quo in US amateur radio in 1998 and 1999. They
did not succeed in retaining the god-like powers of high-rate morse

code testing patronizingly demanded by some.

>You went for change for change's sake, only because the slouchers
>demanded it.

The "slouchers" are now a third of all US amateur radio licensees.

Those "slouchers" were also US citizens, some being military
veterans, who have accomplished other things in life besides
trying to promote continuing standards and practices of the
1930s in US amateur radio.

> Now, you get to lie in the bed you made.

...Freudian slip based on an unsuccessful Saturday night? :-)

>If I read the statistics on the Speroni web site correctly, there has
>been a net gain of 4,063 licensed amateurs since Restructuring
>took place in April, '00.

tRoll reads wrong. The net gain is 3,701 with the gain coming
from no-code-test Technicians. Code-tested US amateur
licensees decreased by 9,431 in that 9-month period. In that
same period 13,132 no-code-test Technicians were added.

It is truly contemptible for some claimed academic graduates
to be unable to handle simple arithmetic on public data. :-)

You don't seriously believe that running a school system has anything to do with educating students, do you? It is the excuse for the game to go on; kind of like the relationship of peanut farming to agriculture.

Many moons ago C. Northcote Parkinson (Parkinson's Law and other Studies in Committeeology) extrapolated then-current trends in the British Navy and concluded that somewhere about now the RN would consist of one destroyer staffed entirely by Admirals supported by 100,000 Admiralty employees and a few hundred-k dockyard workers. Get the book if it is still available.

If you have a good, usually male, teacher, he has a family to support so a deal is made by which he gets hours or actually gets and Ed.D (thereby supporting another game) and becomes an administrator for twice his previous salary. Most administrators are in make-work basically to provide an advancement path when you cannot pay someone for being a good teacher.

American management theory rewards only titular leadership over others. This leads to things like the ZL hired by McDonnell as a chief who quit after a year so he could do some engineering and the police commission scrambling for a way to pay a crackerjack detective who can't pass the sergeant's exam. You wouldn't dare suggest PAYING a good teacher, would you? Or godhelpusall pay a math, Physics, or Chemistry teacher more than the PE coach; the union would have your head.

Far as sports facilities, isn't the function of the high school to entertain the taxpayers???

As a reply I repost here from rraa, a post which no doubt belonged here
in the first place, but it was a response to a codehater who began to
bash code over there, so was answered in kind. This post tells it like
it is. It you folks in Newington see that as an artificial pecking
order, then I might suggest you recruit like hell among the codefree, as
they may well constitute the vast majority of your future membershsip.
All I've seen from Newington so far indicates that nothing will be done
that could in any way be seen as negative nor in conflict of the Grate
Political Correctness that is a code free ARS, the balm of the masses,
whatever their lack of interest in any facet of radio except grabbing a
microphone.

Richard Harrison wrote: on rec.radio.amateur.antenna:
>
> Why learn Morse? Only to fill some arbitrary regulatory requirement.

No,Rich, only to 1.) Learn to use a basic communications mode, and
2.) To qualify for an HF amateur radio license so long as that
qualification is on the books as an international requirement.

> You can learn and practice Morse for fun. It hurts nobody. But require
> it? Morse is already phased out of every pursuit except amusement.

Not so, there are still a number of ham radio CW traffic nets that meet
almost daily to pass traffic, mostly for training and practice purposes.

And it is still used on occasion to actually handle traffic.
During the last hurricane season where there were serious effects from storms experienced in coastal Georgia and Texas, in both those situations emergency nets handled traffic using Morse code when conditions deteriorated to the point that SSB was no longer usable. Of course other modes could have been used had they been in place and at the ready, but they were not, and CW handled the traffic with no difficulty, since there were hams present who were proficient in its use.
Comes the day than no hams are proficient in its use, that won't be possible. That is one reason some advocates of retaining a CW qualification continue to promote it.

> Even last resort claims are more fancy than fact.

In your experience, I'm sure that is correct. All others don't share your view, however, and I have personally experienced circumstances where I would have indeed been pleased to have had radiotelegraphy to fill in for commercial communications failures. But no CW gear was available since it had been replaced and phased out years earlier. I don't advocate that it not have been phased out, that was the only logical action. But in ham radio it is different. Our mission, at least those of us who consider ham radio as anything more than "Just a hobby" ----those of us who believe it to actually be a viable backup communications service to serve on those rare occasions when failure call it into play---- know, without doubt, that Morse on radio is a viable and potentially valuable resource, still. Even in the face of all that has come in the recent past.
Why? The answer is simple-
Radiotelegraphy remains as the most simple, basic, and most easily implemented means of radio communication yet devised. *IF* there are operators available who can use it.

> The idea that Morse enobles doesn`t prove that the same effort spent on
> something else wouldn`t be more enobling.

Not much in life "Enobles". Morse code does not, except in the minds of some of its opponents. But nothing else is the equivalent of knowing and being able to use Morse. Learning Morse code ENABLES.

> It would very likely be more
> useful to spend your time on something else.

Many people feel that way, and that is certainly their right. And it's nothing new.

> If you were to become accomplished in music you might entertain music
> lovers, but not on ham radio. You can talk on ham radio, but you would
> likely profit more from studying the art of conversation than learning
> how to say it in Morse.

Until you developed a bad case of laryngitis. Or were too far from your intended recipient to shout and had no other means to contact him except

Morse. Unlikely, of course.

> The whole Morse argument is beyond odd.

Yes it is. The most odd part of it is that so many who should, and probably do, know better claim that Morse no longer has potential communications value - just because it has been around a long time and there are many other more modern modes and methods.

> The majority of the best conversationalists and scientifically astute
> have no interest in Morse code. If they liked Morse they might have
> become hams among whom Morse is still practiced. Why exclude them from
> any ham bands? They could improve the tone. They should be recruited.

It has always mystified me that so many individuals who can learn so much are put off by so little learning as Morse code represents. When I decided as a kid to become a ham, I don't think it would have stymied me if they had required me to learn Greek. For darn sure Morse code didn't.

> Why exclude the inept in science and conversation who don`t do code?
> They might benefit from the amateur experience, and bring something to
> the hobby that is missing.

Who excludes one who decides he doesn't want to learn something that is really simple but takes a modest amount of time and effort? The person himself! Why exclude him, indeed!

>
> Numbers count!

Any mathematician will confirm that statement.

> With a large market for ham gear, you might benefit from lower unit
> pricing. With a lot more hams, congress would pay more attention to what
> hams wanted. Bigger is better. Minimum requirements is the way to grow.

I've always been one who felt that it should be only as difficult as necessary to obtain a ham radio license, and never more difficult than necessary. As a practicing Volunteer Examiner for the first eight years of the new VE system I always put that exact philosophy into practice, and there are many licensed hams who were tested by my team who will confirm that. I am not a "big" CW man, by any stretch of the imagination. I do believe firmly, however, that all ham radio operators should feel the responsibility to take it onto themselves to learn to use the most basic and most simple mode of radio communication.
Any ham who cannot operate effective CW is not an accomplished ham, whatever his other accomplishments. CW is BASIC radio communication.

>*former* amateur frequencies. Time will tell, but for now, my
>license stays on the wall of my "shack."

Actually, regarding 500MHz and up, I suspect you are
probably correct. The interesting point, however, is that
those frequencies above 500MHz have very limited
use to most hams except for short distance transmissions...which
is exactly why the cell phone/pager/PCS folks want them.
I truly wonder what percent of all hams have ever made even
a single contact on any frequency (ham frequency) above
500 MHz?

Dick, as you ought to know, I have zero problem with Morse as an operating mode. I've spent far more time operating Morse than I have operating any other mode, and I expect that to continue. But it's not the be-all and end-all of ham radio, nor do I consider Morse skill to be the litmus test of amateur ability that you think it is. Still, I have no problem with people who believe that Morse testing has a value that makes it desirable to keep it as a requirement, even though I happen to disagree with that particular viewpoint. What I do have a problem with is people who look down on others simply because those others have not passed a code test. Equally, I have a problem with those who look down on others who *have* passed a code test. Both of those extreme viewpoints are occasionally expressed in this NG; both are equally wrong.

Jon

Bill:

I'll admit that I have supported the concept of a progressive, multi-tiered licensing system, for the purpose of encouraging continued learning and communications skill development by using increased operating privileges as the incentive. I have not, to the best of my knowledge, supported this system merely to keep an elitist "pecking order" in place. That is the fear of the no-coders, to be sure, but those of us who have reached the top of the former licensing structure don't really consider that achievement that unique, since people of all ages and from all walks of life have done so. The notion of a "pecking order" is just another specious construct from those who pander to the politically correct popular culture. Purely nose-piercing and pony-tail stuff -- with no relationship whatsoever to the reality of people who understand how to achieve things on their own.

In other words, Dick, those of us who support reasonable
testing requirements to ensure that radio amateurs can effectively
employ one of the most useful communications modes in the ARS
are extremists; those who support the concept of touchy-feely,
politically correct "inclusiveness" are in the right, due to the fact
that they meet the needs of a much larger clientele. Jon's
gracious admission that he has a "problem" with people who look
down on others who have passed a code test notwithstanding, this
is just more of the usual pandering from 225 Main St.

>Bill K2UNK

Bill:

Probably around .05 percent, and that's being generous. I've personally never owned any amateur gear capable of generating a signal above a frequency of 1.2 GHz; and I've only made two successful QSO's in that band. The problem: Nobody to talk to -- even many years after the adoption of 100% codeless licensing for operating privileges in that spectrum. We (the amateur community in general) were given airtight assurances that removal of the 5 WPM code test from the Technician-class licensing requirements would inspire major growth in amateur radio and widely increased utilization of our spectrum in the UHF range -- largely dedicated to high-speed digital data communications. Yet, after all this time, I can not send a wireless message over strictly amateur-based circuits any further than my own county line -- and most of the time, I can't even get that far! Therefore, I can't help but wonder why giving away HF phone privileges is supposed to be such a major benefit to our service. I say, the sooner commercial interests start doing some productive and profitable work on that spectrum, the better. I wouldn't sell off our amateur spectrum above 500 MHz -- I'd give it away free to whomever proposed the best commercial use thereof, in order to stimulate that business and all of the economic benefits that would come with it.

I'm not talking about a radio, Dick, I'm talking about any signal. I said it
was a hypothetical exercise. But if the added modulation were done before
the signal reached the receiver, it would be even more impossible to detect.

Richard Harrison wrote:

> CW may be basic, but it is no prerequisite to any other mode.

Of course not, it is prerequisite unto itself- you can't use it if you don't know how.

>
> CW has been defended as essential to emergency communications,

No, it has not- it has been shown to be the most basic of radio communications modes, still very effective even though it is quite ancient by comparison to the flashy efficient new modes that require much more hardware overhead and support.

> which is
> mistakenly claimed as a mandate of amateur radio.

You can ignore the history of the amateur radio service but your attitude cannot change it.

>
> Amateur radio is a hobby.

Sure it is. But unlike almost all other hobbies, it is something much more. No stamp or coin collector will ever find himself in the position to use his hobby to perform critical public services. Most hams will never see the time when they are called to do so, either. So in your opinion no ham need ever prepare nor expect such a thing to happen nowadays, what with cell phones and satellites. Your understanding of the frailties of modern communications belies the level of your education and experience. You simply should know better than that. For some strange reason a number of engineer-hams suffer from that very deficiency. Oddly, many are no-coders, also.

> Amateurs set up emergency and public service groups in which they can
> put their communications gear to good use. It`s all voluntary. Cell
> phone users can do the same. If the cell phones fail, there are
> satellite phone and internet connections. There are more do-gooders with
> cell phones than radio amateurs. They are welcomed volunteers with the
> Red Cross, etc..

This paragraph only shows your lack of expressed knowledge of reality of life in the world of communications. Only ham radio incorporates such a diversified widespread cadre of operator/stations as to be capable of detaching itself from the gridded infrastructure to the extent that it

can function on its own without dependence on such things as power grids, networking schemes, or both. When the lights go out for long periods, or some natural calamity comes, the telephone network clogs- did you ever get the "all circuits are busy" notice? Don't even mention the cellphone network. It was never designed to handle large percentages of its subscribers and saturates straight away. Satellite phones? You mean IRIDIUM? Globalstar? Yeah, right! Not much help there. ALL public safety comms are in instant overload when the ship hits the sand, been there and done that. That leaves FRS and CB. Real organization and true communications capability there, for sure. NOT!

So you go right on blithely assuming that all is well, and your world is secure. If you lived in California you would have assumed, until a couple weeks ago, that your lights were certain to stay on at will, too, and there would always be a working traffic signal at each intersection on the glutted streets and highways.
Modern communications systems are far more fragile and vulnerable than you evidently can imagine. Ever hear of the "Digital Pearl Harbor"? Everything out there is ran by computer these days. That makes everything vulnerable to the hackers. Microsoft itself is not secure. What next? It won't necesarily be a natural disaster that takes modern comms down.
A few years ago in a fairly large town not far away a fire in the central telephone office put the city off all telephone service for days. Meanwhile, the local ham radio 2meter repeater filled in nicely for local critical communcations. Later the telephone company awarded the ham radio club repeater space on its mountaintop site in appreciation of their help. Not a big deal, and rare, but just one more example. So many of you code bashers are so eager to do away with all but the "hobby" aspect of ham radio. Why?

> Amateur emergency help may be welcome, but it is seldom essential.

And when it is essential it is far more than welcome. It is - well, essential.

> Newsflash: Amateurs don`t have to earn spectrum for their radio hobby
> through good deeds. They have access rights simply by getting an FCC
> license.

Ah, now we get down to it. "I have a right". Sure you do. One which can be withdrawn at the stroke of a pen "In the public interest, convenience and necessity".
Comes the time when amateur radio is seen by officialdom as nothing but a burdensome klaven of simple hobbyists and troublesome misfits, a significant portion of whom really don't care, and that pen stroke becomes reality. It has been made perfectly clear that the slide in the direction of worthlessness as a service has been in progress within the Amateur Radio Service for decades.
The instant brouhaha merely serves to grease the skids.

> Just as commerce and industry are worthy and have rights, so do
> individuals, for their life, liberty, and pursuit of happiness.

Which does NOT include transmitting access to any part of the radio spectrum for recreational purposes. There is a "basis and purpose" for the amateur radio service in the FCC rules. You really should read it sometime.

> Dick Carroll is dwelling upon long gone times and conditions before
> there were modern communications.

Very creative writing, Rich, but far too unrealistic to gain credibility as fact.

This is the *real reason* you don't like Code Quick. People who have
no intention of ever using the code on the air have found success in
using Code Quick to quickly pass the code test. But then I suppose
that's similar to people who have no intention of learning electronics
using memorization to quickly pass the written test...

No, the extremists are those of you who denigrate those who haven't taken the same tests as you. In short, it has nothing to do with code testing and everything to do with how you treat people. If you think how you treat others is a issue of "political correctness," well, that pretty much proves my point.

Since when are you an expert on how the human brain works? Do you have any proof that CodeQuick doesn't achieve its purpose of helping one pass the code test, other than your own subjective opinion?

>>I challenge you to find anyone who tried Code Quick but failed.
>
>Well, all I can say is, I know a lot of people who own the tapes,

Obviously false, Larry. The reduction/elimination of Morse code testing
is the reduction/elimination of its federally sponsored welfare support
program. When a person receives welfare, he/she receives something tangible
that he/she can hold in his/her hand. There's absolutely nothing tangible
being given away. To think otherwise is to think like a Liberal.

Well...Let me be the first to say it here. Nah...Vince and others may
have said it first.
>
> >> I don't find myself feeling limited by the number of
> >> license classes in the ARS.

Maybe that is because YOU are not meeting the Basis and Purpose of Ham
Radio yourself.

> >> Necessity is the mother of invention,

Yes and it is necessary to have a basis and purpose to this hobby and
it is necessary for many hams to meet that basis and purpose or the
hobby will not only lose government support...It will be unable to
attract new members.

> >>not
> >> wallpaper. Interest and curiosity must provide motivation. Without
> >that I
> >> think you'd have to convince the US Treasury to issue their
> >certificates
> >> rather than the kind the FCC offers.

Some attitude...Many affluent folks think that money is the only thing
that talks. Ham Radio once was a hobby which attracted frugal people
who built their own radios and got technically educated at low cost.
Today the technical knowledge required to be a ham has little
commercial value and it is a fact that most Hams buy rice boxes.
> >>
> >> 73, Jim AC6XG

There is no cycle the subject is a linear opinion that must be
considered and most of the posts here which brag or complain about the
hobby eventually get down to this kind of logic.
>
> >Such a license could command
> >real respect, not for just individual hams, but for Ham Radio as the

I have a BSEE...but when I did not have a BSEE my ham license meant
more to some employers than a BSEE because I had been able to show that
as a Ham I had been able to build my own equipment from scratch. Most
tech school and college grads did not have the practical experience
that most Hams had in those days. Today things are a lot different
because most Hams are not keeping up with the latest technology or
building anything themselves. How can Hams, as Hams, meet the parts
of Part 97 Basis and Purpose goals (which say that hams should be
prepared to asdvance the state of the art) without changing their basic
primary motivation to be hams??? My answer is by drastically changing
their attitudes. When they do they might just be suprised to find that
Ham Radio can again attract lots of new techies as well as the computer
clubs seem to now be able to do. Bill Gates didn't have to finish
getting his college degree...Neither did Edison, Farnsworth, Sarnoff,
etc. For most older Hams it may be too late to expect them to now keep
up with modern technology {they are veterans of the technologies of the
past)...BUT let it not be too late to attract new hams into our ranks
by offering more modern challenging exams that can not only give more
pride but can prove more value. Ham Radio must have the same vaue to
the individual and the USA as it had in 1940 and 1950. This is not an

impossible goal...but it is hampered by old Hams who are only
interested in what Ham Radio means to them. Many existing hams fear
that any additional technical exam requirements might take away their
frequency privileges or their ability to call themselves "Extra
Class". The subject is PRIDE.

> <Snip of same old/same old>

Yep...Snip it if you want to but its meaning won't go away.
>
> Cheers,
> Bill K2UNK
>
73...
Cheers for the Hams who are not afraid to take MORE ham exams.

Bob Wex w2ilp (Insure License Potential)

In history it is always those with little
learning who overthrow those with much
learning...When young people grasp a truth
they are invincible and old people can not
compete with them.
--Mao Tse-tung (1958)--

Mao was getting old when he said the above.
--w2ilp--

The young techies of today are motivated
to repair their computer hardware and
hack their computer software...but the old
or the young hams are no longer being motivated
to repair their radios or even to try. Why would
a young techie of today want to be a ham?

>communications.

Just exactly who gave those "airtight assurances?" The 1990
Report and Order that created the Technician class simply
created the Technician class license. The FCC did not give
any "airtight assurances" other than the creation of that class.

However, tRoll is quite WRONG on "major growth." Major
growth was enough to make the single no-code-test Tech
class within a percentage point of ONE-THIRD of all licensees

as of the end of the year 2000.

As to the utilization of VHF and higher, where were the
ALREADY LICENSED US radio amateurs? They were, and
still are, able to operate on all allocated bands on up to the
300 GHz allocation limit.

tRoll bitches and complains about "underutilization" when
he was part of the problem of underutilizing spectrum.

> Yet, after all this time, I can not send a wireless
>message over strictly amateur-based circuits any further than my
>own county line -- and most of the time, I can't even get that far!

Here's a thought: Try asking for help on what you are doing wrong.
It would seem you aren't doing it right.

>Therefore, I can't help but wonder why giving away HF phone
>privileges is supposed to be such a major benefit to our service.

The FCC doesn't regulate or license radio amateurs to some
sort of "major benefit to your service." The FCC regulates US
amateur radio as one of MANY different US civil radio
services.

tRoll wants a federal subsidy or federal recognition for "time in
grade" as a code-tested ham superbeing?

>I say, the sooner commercial interests start doing some productive
>and profitable work on that spectrum, the better. I wouldn't sell
>off our amateur spectrum above 500 MHz -- I'd give it away free to
>whomever proposed the best commercial use thereof, in order
>to stimulate that business and all of the economic benefits that
>would come with it.

So...just to prove your "superiorness" or whatever ego-trip thing
you are doing here, you wish to SELL OFF everything above
500 MHz because no one will talk to you up there?!?

tRoll, why do you wish to destroy FREE SPECTRUM for all
others?

>merely to keep an elitist "pecking order" in place.

By all evidence of your statements in here you DO wish to keep the pecking order alive and well because you've managed to get to the "top" of the old pecking order.

>That is
>the fear of the no-coders, to be sure, but those of us who have
>reached the top of the former licensing structure don't really
>consider that achievement that unique, since people of all
>ages and from all walks of life have done so.

Oh, dear, more hypocrisy. That SOME others have jumped through hoops conceived and lobbied for by elitists, those at the top of the pecking order (tRoll included) can now claim superiority and insist that everyone else do as they did.

>The notion of
>a "pecking order" is just another specious construct from
>those who pander to the politically correct popular culture.

Bullshit, tRoll. The pecking order arrived, was joined by those who believed in the popular culture of the "incentive plan" multi-tiered US amateur license class structure... along with the Vanity Call system codified in law so that

younger, less-knowledgeable-about-theory, but capable of
fast morse code rates could pretend to be old-timers with
1x2 and 2x1 call signs.

>Purely nose-piercing and pony-tail stuff -- with no relationship
>whatsoever to the reality of people who understand how to
>achieve things on their own.

So...no doubt everyone will be treated to yet-another go-around
on how the tRoll set about disciplining himself and worked Real
Hard to rise to the top of the amateur pecking order? That
everyone else can do the same as he but everyone who does not
share his views, aspirations are somehow "inferior?" :-)

The question is not whether or not tRoll, by himself, accomplished
anything. The question is whyinhell are there certain standards
and requirements in US amateur radio regulations. tRoll has
danced around that without answering, his only rationale ending
with a statement of his Hard Work and Dedication.

Hard Work and Dedication to old standards and practices
should be respected. However, that respect does not carry
through to enforcing the SAME thing to all newcomers by
codifying it in law. If that were the case, amateur radio would
have ended with the outlawing of spark emissions...the major
transmitters of amateur radio in the beginning. Old-timers of
that era would have insisted that all newcomers DO AS THEY
DID. :-)

I don't think we need Morse Code conscription at this time either.
Stating such, however, does appear to make me "anti-Morse Code" by some.

Remember Larry, Morse is PEEU and doesn't need government price
supports. Its so PEEU that people stand in line to learn it.

Which STILL makes the CODE TESTED licenses 66 2/3 of the total, a
majority (not that it matters) by ANYONE'S definition.

And in as much as the Technician Class is now only one of three
licenses available, what's so significant that it's "one-third of all
US licensees", other than you trolling for another "no cw test"
arguement?

Not that we'd expect anything less.

> Specifics, please -- include any relevant
> documentation -- news articles, media releases,
> etc.

You're right, Larry, newly licensed hams have probably not contributed a thing - only more advanced license holders such as yourself could contribute anything to ham radio. By the way, exactly how many contributions have you made to ham radio over the great many years you've been involved (be sure to include any relevant documentation -- news articles, media releases, etc)? Now, we're not talking about routine stuff like emergency communications, and so forth (plenty of newly licensed hams do that). We're talking about those special contributions that you've made, that, as you suggest above, newly licensed hams don't make.

> Hmmmmm again. Just where did I state that
> "newly licensed operators" were not "decent
> people?" Please provide quotes from Deja.com.

Trying to change the subject, Larry? I've never accused you of saying that newly licensed operators were not decent people. What I said is that you've carried on an endless campaign to belittle newly licensed operators with the use of derogotary names and insulting characterizations. And I don't need Daja.com to verify that - anyone who has been involved with this newsgroup for even a month or two has saw it themselves many times.

> I could care less how you obtained your
> license, Dwight.

Sure you do, Larry. You've posted many, many, messages over the last few years complaining about ham operators who got their license without a code requirement.

> The way you obtained your license does not
> make me upset and I wouldn't dream of asking
> you to give it up. [snip]

I'm sure you wouldn't ask me. It would be a disaster for you if everyone who got their license without knowing code gave up that license - it would leave you with absolutely nothing to complain about (something you obviously need to do on a regular basis).

> Again, I am not "upset." The code requirements
> were there for me to achieve, and the fact that
> they are no longer standing in YOUR way makes me
> happy for you! I got to prove something to myself
> and others through the application of diligent
> effort -- and you didn't have to! Everything
> worked out well for both of us.

And that is the major difference between you and me. Because of my involvement with marine communications (my "diligent effort" goes there), I got involved with ham radio to learn more about radio (not just to get a license to impress people with - which, based on how often you make an issue out of the class of license you hold, seems to be your goal). After that, ham radio is just a hobby that allows me to experiment, practice radio techniques, and enjoy conversations with friends.

> No upset here, Dwight. I'm fine.

I'm glad for you, Larry.

I haven't posted to the groups that Hans suggested yet, however I
did take a look at the link AC6V sent. I guess calling what I heard
a "long delay echo" was really innacurate. I was hearing the return
ping at the receiver reset from transmit, so it was a very short
enroute time from where ever the echo was occuring. Less than 90K miles?

Considering the extremely modest antennas I run for HF, I would
exclude any side-lobe presentation. Perhaps a true circumfrential
return?

73 and thanks to all.

They said that the code test doesn't prove anything about character. They never said it doesn't prove "anything". Obviously it proves code proficiency. They have more of a neutral bias on the issue than you do, I think..

If the noise floor reaches the ceiling as you say, it'd still be easier to
copy CW out of it than it would be to copy phone.

Code-tested licensees are DIMINISHING in number. The
trend is there, visible to all except those who wear blinders
of old-time CW radio.

Non-code-tested licensees are INCREASING in number.

If it weren't for the 1990 creation of the Technician class
license in the USA, the number of USA radio amateurs
would be DECREASING in number.

That trend has been clear to the FCC for over a decade.

That trend hasn't been seen by those who jumped through
old-standard hoops or who think they are "boss" in ham
radio through meeting old standards.

> And in as much as the Technician Class is now only one of three
>licenses available, what's so significant that it's "one-third of all

>arguement?

Wrongo. The restructuring only removed three of six NEW-
license classes. Novice, Technician-Plus, and Advanced
classes are still in the US amateur radio database AND in
the revised Part 97.

For those who have taken an overly-long lunch hour (perhaps
to another planet), the morse code test is STILL PRESENT in
US amateur regulations for General and Extra classes.

The morse code test for any worldwide amateur radio license
is STILL PRESENT in ITU-R standard S25.5.

> Not that we'd expect anything less.

What is your point by that closing crack? Are you going to
launch into the usual personal attack commentary? Try to
avoid such comments since you can't win a single thing by
doing so.

Why are you screaming that the other side has no evidence and your side does -- without offering the evidence to support your position?

Your arguments throughout the various permutations of these debates have been based entirely on personal opinion and entirely on as much anecdotal evidence as you accuse the others of offering.

You are sure "if the truth be known it support [you]." Yet you offer no statistical evidence of your own, only continual demands that those who disagree with you do the research so that you can nit-pick it.

Put up. Is there less CW activity as a result of the 5wpm? How do you know? Anecdotes from HF operators? Statements from new 5 wpm Hams about what modes they are using? Is there more or less QRP interest since 5wpm? Among new 5wpm-ers or among oldtimers? What is the evidence? Not what you think, what are the facts? What can you prove?

I was almost happier when you were posturing yourself as the gatekeeper of appropriate callsigns. Now you are the determiner of Ham motivation. "Everyone knows..." is not a fact. "When I started..." is a fact only for you. Whether it applies to anyone else is an opinion. Why someone is motivated is so personal to that person that your attempts to describe every Ham as sharing your motivations and your interests is close to an insult.

And NOT being issued by the FCC. Novice licenses were essentially
zero for years, Tech Plus was just a matter of an administrative
update, making the Advanced Class the only real spoiler for your "no-
code" arguement.

> For those who have taken an overly-long lunch hour (perhaps
> to another planet), the morse code test is STILL PRESENT in
> US amateur regulations for General and Extra classes.

More "no kidding", Lennie. A whopping 5wpm, which will be ZERO
wpm before too long, afterwhich your life will be TOTALLY irrelevant.

> The morse code test for any worldwide amateur radio license
> is STILL PRESENT in ITU-R standard S25.5.

Whoopie doo. After WRC-2003, that's probably going to change. I
KNOW you refuse to acknowledge it, but you just keep jousting at that
windmill, Quixote. Sooner or later it will cry "Uncle".

> > Not that we'd expect anything less.
>
> What is your point by that closing crack? Are you going to

Lennie, YOU are the last person in this newsgroup who has ANY right
to whine about "personal attack commentary".

First and foremost because YOU are the Preeminent Abuser of the Ad
Hominen Attack. You revel at it. We wouldn't be having THIS exchange
if you weren't. So take your crocadile tears and stuff them.

Secondly, I am not the one trying to "win" anything here,
Anderson. I HAVE a license. I AM an Amateur. I HAVE all those perks
and priviledges that having taken all those tests conveys.

You DON'T have a license because you have neither the guts nor the
character to do it, and I am tiring of your incessant whining and
hatred of Amateur Radio.

Now, run along, loser. Your troll is kaput.

ENGINEERS EXPLAINED

People who work or play in the fields of science and technology are not like other people. This can be frustrating to the non-technical (QCAO) people who have to deal with them. The secret to coping with technology-oriented people is to understand their motivations.

Engineering is so trendy these days that everybody wants to be one. The word "engineer" is greatly overused. If there's somebody in your life who you think is trying to pass as an engineer, but is really only a Technician at best, (often only an Appliance Operator) give her(or him) this test to discern the truth.

ENGINEER IDENTIFICATION TEST

You walk into a room and notice that a picture is hanging crooked. You ...

A. Straighten it.
B. Ignore it.
C. Buy a CAD system and spend the next six months designing a solar-powered, self-adjusting picture frame while often stating aloud your belief that the inventor of the nail was a total moron.

The correct answer is "C" but partial credit can be given to anybody who writes, "it depends" in the margin of the test or simply blames the whole stupid thing on "Marketing."

FASCINATION WITH GADGETS

To the engineer, all matter in the universe can be placed into one of two categories:

1. Things that need to be fixed, and
2. Things that will need to be fixed after you've had a few minutes to play with them.

Engineers like to solve problems. If there are no problems handily available, they will create their own problems. Normal people don't understand this concept; they believe that if it ain't broke, don't fix it. Engineers believe that if it ain't broke, it doesn't have enough features yet.

No engineer looks at a television remote control without wondering what it would take to turn it into a stun gun.

No engineer can take a shower without wondering if some sort of Teflon coating would make showering unnecessary.

To the engineer, the world is a toy box full of sub-optimized and feature-poor toys.

HONESTY

Engineers are always honest in matters of technology and human relationships. That's why it's a good idea to keep engineers away from customers, romantic interests, and other people who can't handle the truth.

Engineers sometimes bend the truth to avoid work. They say things that sound like lies but technically are not because nobody could be expected to believe them. The complete list of engineer lies is listed below:

- "I won't change anything without asking you first."
- "I'll return your hard-to-find cable tomorrow."
- "I have to have new equipment to do my job."
- "I'm not jealous of your new computer."

POWERS OF CONCENTRATION

If there is one trait that best defines an engineer it is the ability to concentrate on one subject to the complete exclusion of everything else in the environment. This sometimes causes engineers to be pronounced dead prematurely. Some funeral homes in high-tech areas have started checking resumes before processing the bodies. Anybody with a degree in electrical engineering or experience in computer programming is propped up in the lounge for a few days just to see if she [or he] snaps out of it.

RISK

Engineers HATE risk. They try to eliminate it whenever they can. This is understandable, given that when an engineer makes one little mistake, the media will treat it like it's a big deal or something.

EXAMPLES OF BAD PRESS FOR ENGINEERS

- Incentive Licensing
- Hindenberg
- Space Shuttle Challenger
- SPANet (tm)
- Hubble space telescope
- Apollo 13
- Titanic
- Ford Pinto
- Corvair

The risk/reward calculation for engineers looks something like
this:

RISK - public humiliation and the death of thousands of innocent
people.
REWARD - a certificate of appreciation in a handsome plastic frame.

EGO

Ego-wise, two things are important to engineers:

1. How smart they are.
2. How many cool devices they own.

The fastest way to get an engineer to solve a problem is to
declare that the problem is unsolvable. No engineer can walk
away from an unsolvable problem until it's solved. No illness
or distraction is sufficient to get the engineer off the case.
These types of challenges quickly become personal - a battle
between the engineer and the laws of nature.

Engineers will often go without food and hygiene for days to
solve a problem - other times, just because they forgot. And
when they succeed in solving the problem they will experience
an ego rush.

Nothing is more threatening to the engineer than the suggestion
that somebody has more technical skill. Normal people sometimes
use that knowledge as a lever to extract more work from the
engineer. When an engineer says that something can't be done
(a code phrase that means it's not fun to do), some clever
normal people have learned to glance at the engineer with a
look of compassion and pity and say something along these
lines: "I'll ask Bob to figure it out. He knows how to solve
difficult technical problems."

At that point, it is a good idea for the normal person to not
stand between the engineer and the problem. The engineer will
set upon the problem like a starved Chihuahua on a pork chop.

A numerical majority simply because almost all those so licensed
had no alternative. It was either pass a code test or no license
at all. Later it became (and still is) pass a code test or no
HF operation. As such, those that have a code license include
many that would have no support for code requiremments.

> And in as much as the Technician Class is now only one of three

Really? If I were God, I wouldn't want to be on a code tape!
If I were God, I'd get together with all my other God friends
and have a big party. We'd all get drunk and create unliftable
rocks, then try to lift them. It would be loads of fun! Then I'd
probably just destroy the rocks with a lightning bolt. Then I'd
probably pass out. :^)

None. but you must have a license if you decide to transmit with it on amateur frequencies.

>> tested license classes.
>
>That's a funny kinda scale you got there, Len. You either need to have
>it calibrated, or you need to try to keep your thumb off of it.

Nice try, Jim, but let me cut and paste from my original post -

As of the end of December 1997, code-tested licensees
were 73.4% of the total, non-code-tested licensees were
26.6% of the total.

By the end of December 2000, code-tested licensees
were 67.9% of the total, non-code-tested licensees were
32.1% of the total.

==========

So...going from 73.4% in '67 to 67.9% in '00 for code-tested
and going from 26.6% to 32.1% for not-code-tested doesn't
indicate the scales are shifting? Amazing non-observation
on your part, Jim. Or do you just want to obliterate any
comments that cast doubt on newcomers not favoring code?
Jim

I believe your thumb is somewhere...and not on any posting.

I said it was so. I've been saying so for some years.

What is your point...besides trying to start yet-another "battle"
in here on personalities?

> The only person wearing blinders here is YOU, Chump. You CAN'T
>(or worse, WON'T) see that Amatuer Radio is moving along nicely without
>you or your opinion. TOO BAD FOR LENNIE!

"Amatuer?" Is that anything like a Heath lunchbox rig on 2m?

On subtracting the overall gains from new Technician class
licensees over the last 3 years, the remaining five classes
show a DECLINE IN TOTAL NUMBERS. That doesn't mean
that Amatuer (or even amateur) radio in the USA is "moving
along nicely."

> Must be TERRIBLE to not be wanted!

The whole subject is not about "being wanted." It is rather
in pointing out what others have wanted...and that want is not
morse code skill tested and approved with an official
government merit badge.

>> If it weren't for the 1990 creation of the Technician class
>> license in the USA, the number of USA radio amateurs
>> would be DECREASING in number.
>
> Prove it.

The proof is in the tabulation of publicly-available data on the
AH0A website. Simply subtract the number of Technician
class licensees from the total US ARS licensees. The total
of all code-tested licensees is DECREASING.

>> Wrongo. The restructuring only removed three of six NEW-
>> license classes. Novice, Technician-Plus, and Advanced
>> classes are still in the US amateur radio database AND in
>> the revised Part 97.
>
> And NOT being issued by the FCC. Novice licenses were essentially
>zero for years, Tech Plus was just a matter of an administrative
>update, making the Advanced Class the only real spoiler for your "no-
>code" arguement.

Really really lame response. I said that the FCC is NOT issuing
any NEW Novice, Tech-Plus, or Advanced licenses. Quit trying
to prove some point by rewording it.

Have the regulations in Part 97 eliminated the Advanced, Tech-
Plus, or Novice licensees? No. They are still there in current
law. The USA still has 6 classes of amateur radio licenses.

>> For those who have taken an overly-long lunch hour (perhaps
>> to another planet), the morse code test is STILL PRESENT in
>> US amateur regulations for General and Extra classes.
>
> More "no kidding", Lennie. A whopping 5wpm, which will be ZERO
>wpm before too long, afterwhich your life will be TOTALLY irrelevant.

Define "too long," hotshot. WRC-03? How do you "know" that?
There is nothing firm in ITU agendas or study group documents
or FCC International Bureau agenda items that indicates ITU-R
S25.5 will be discussed at all, let alone be voted upon.

According to the FCC International Bureau there will be some
discussion at WRC-03 on S25. S25 is the entire set of amateur
radio standards.

> Whoopie doo. After WRC-2003, that's probably going to change.

You can't know that.

For one thing, the recent ARRL BoD policy position was to NOT
make any statements on what the FCC should do IFF ("if and
only if") S25.5 were deleted. If the ARRL has any clout with the
FCC then that policy position would have the FCC *KEEP* the
code test even if the ITU-R S25.5 were deleted. [do you under-
stand the significance of that or do you only want to fight about
personalities?]

>KNOW you refuse to acknowledge it, but you just keep jousting at that
>windmill, Quixote. Sooner or later it will cry "Uncle".

ALL laws, rules, regulations may appear to be sturdy "windmills"
that refuse to be beaten. However, all those laws, rules, and
regulations were made by man...and can be eliminated by man.

It is not an quixotic undertaking in attempting to change law,
Sancho Panza.

> Lennie, YOU are the last person in this newsgroup who has ANY right
>to whine about "personal attack commentary".

Poor baby. You want to strut around as a Dill Instructor and
issue orders as if you had some USMC rank in here...and then
accuse others of "improper behavior."

Tsk, tsk, tsk...nobody is Obeying the Dill Instructor.

But, big steebie HAS to make this a personal issue with -

> First and foremost because YOU are the Preeminent Abuser of the Ad
>Hominen Attack. You revel at it. We wouldn't be having THIS exchange
>if you weren't. So take your crocadile tears and stuff them.

Poor baby...you want to Issue Orders and then get all bent out
of shape if someone comes on back IN KIND and shoves it
back down your throat. Tsk, tsk, tsk, tsk....and tsk.

> Secondly, I am not the one trying to "win" anything here,
>Anderson. I HAVE a license. I AM an Amateur. I HAVE all those perks
>and priviledges that having taken all those tests conveys.

Oh, my, yes. :-)

Poor baby is suffering Lack of Respect Syndrome?

I started this particular thread regarding newcomers opting for
what in USA amateur radio. Based on publicly-available data
as tabulated by Joe Speroni on his website (AH0A is a fan of
morse code). This thread was NOT about big Steebie or his
accomplishments, didn't even name Robeson or even hint at
that noble eminence.

That the US ARS newcomers are NOT opting for morse code
has nothing whatever to do with personal viewpoints of anyone
who is already maximally "upgraded" in licensing.

> You DON'T have a license because you have neither the guts nor the
>character to do it, and I am tiring of your incessant whining and
>hatred of Amateur Radio.

Poor poor little peurile creature still trying to taunt and belittle
newcomers or maybe-comers as if this were the USMC.

It's sad that the maximally-upgraded non-comms of US amateur
radio have sunk to such a level. One could well imagine these
militaristic patronistic self-elevated knowitall jerkoffs demanding
"blood pinning" to prove their amateur radio worth.

Get this through your cartilage-filled cranium, Steebie, I have NO
repeat NO "hatred" of amateur radio. I once had thoughts of
getting an amateur license to round out my commercial license
and have some fun in retirement. Those thoughts have been
repeatedly dashed for around two decades by the self-important,
self-appointed non-comms of US amateur radio who keep

insisting that all newcomers have to de exactly as they did or be the subject of all kinds of personal abuse.

Now, it is my experience that MOST radio amateurs are not the self-important, self-appointed non-comm Dill Instructors of some kind of US Amateur Marine Code Corps...but there are just enough of YOU around to make it unattractive to many..

> Now, run along, loser. Your troll is kaput.

The original starting message of this thread was not a troll, but rather a refutation of some statements made by some self-important, self-appointed non-comm Dill Instructors in other platoons of the US Amateur Marine Code Corps.

Now put on your campaign hat and run some code cadets through some close order drill. Try to stay out of discussions of radio regulation changes and, certainly, radio theory. You can't handle either.

It's the SUBJECT, not personalities stupid.

didit

PS: "Non-comm" is an individual who cannot communicate in any reasonable discussion other than to denigrate and villify those persons who do not share the non-comm's viewpoints. A "Dill Instructor" is the self-styled non-comm who struts around shouting Orders To Be Obeyed as if the amateur radio service were really a Military Service.

Jon, there's sure nothing artificial about that boatload of nonsense,
it's the real thing for certain.

When the Extras of today are commonly licensed with no more technical
nor code qualifications than Novices of old, and nothing has changed but
some vaporous "artificial pecking order"??
You know the appropriate descriptive word - and it isn't bullfeathers.

Dick

Entire rambling, self appreciating trash deleted.

Leonard, I tried to read through the post, but it's just more of
the same.....you took a powder from the NG for a while, but now your
spite is built up again and you just can't help yourself.

You are a very sick, tormented and dying man, faced with your
impending mortality. You haven't adjusted. There are/were things you
wanted to do in life but never did for whatever reason, and by-golly
SOMEONE is going to pay for it.

Unfortunately, it is US.

No one gives a damn about the Sperroni numbers, how you single-
handedly built a USN/USA communications net out of an old TV and a pair
of 6146's, or your opinion on Morse Code testing. They don't matter.

You have proven how callous and shallow you are on occassions TOO
NUMEROUS to count. You have insulted and denigrated just about every
subset of society that you can that is "not you" in order to try and
prove YOUR superiority.

I know you think this NG is somehow important or that anyone here
really gives a hoot about you, your opinion, or MY opinion ABOUT you,
but the fact remains that this is just a respository for "actin' a
fool", and you, Lennie the Licenseless, are it's center stage court
jester. (You WERE in second place, but first place got wise and got
lost, so you ascended to first only through attrition)

Meanwhile, those of us with a license (regardless of class) will
be having fun on a radio tonight while you slather over the keyboard to
make some meaningless and ineffectual response to this post.

Good night, Lennie. Your life whittles away.....

PS: This was for you.....

Meaningless, Bill.

We are now into our 11th year of the "no code" era. And with the exception of a brief explosion of new licensees in 91-92, the "growth rate" of Amatuer Radio has hardly been "stellar", and barely above attrition.

The NCT has NOT been the "growth hormone" it was cast to be at it's inception. Is it beneficial...?!?! Of course it is. But it's NOT been the "fix all" that it was forcasted to be at it's onset.

Lennie makes some deal about how this is the "fastest growing class" of licensee. Well, I'd say that it's NO WHERE close to being where it COULD be, and it's NOTHING close to being some revoloution that Lennie claims.

You said that the code tested licensee's were that way because they had no other choice.

I suggest you go back and research the demographics of the current TechPlus and above licensees and look at the dates of thier entry to Ham Radio. More than half of that 66 2/3 HAD a choice.

PRIDE comes with motherhood or fatherhood but there are no classes
required to become a mother or father....unless you want to count
optional sex education from Dr. Ruth.

> How many license classes are needed for hams to be able to construct
their
> own gear?

NONE.

All Hams are permitted by law to build anything that they want to build
and this includes Radio transmitters, provided that the transmitter
outputs comply with FCC regulations (It does not include propriatory
descramblers or items that could be used by spies which might be deemed
illegal or a threat to national security). BUT do hams want to build
anything themselves if they have no confidence that they are smart
enough to do so? Are most US hams in favor of having the state of the
Ham Radio art advanced solely by Japanese hams?

BUT many more license classes are needed for hams, as a group, to
comply with the goals of the basis and purpose of amateur radio. This
is now especially true because President George W. Bush wants all
levels of education to be accountable. "Accountable" means taking
appropriate written tests to establish all standard levels of
education. Pres. Bush says this was necessary in Texas and is also
necessary in the entire USA, since the value of education available can
not meet national goals without such tests. If ham radio is to be
exempt then it must admit that it is no longer a worthy educational
hobby. If it is not to be exempt then we need more tests. If a
majority of Hams can not pass the tests...I'm sure that Pres. Bush
wouldn't want to take away their licenses or privileges.
Hmmmm...Maybe we can get the federal government to issue vouchers so
that Hams can get "better" Ham Radio classes at the church of their
choice.

Nah...Maybe many Hams are in favor of separation of signals from noise,
communication from spam...and church from state.

73, Bob Wex w2ilp (Intelligent Learned President?)

Folks are dumb,
Whar I come from,
Bout schools 'n books n' lernen.
Still they die at ninty-three...
Doin' what comes naturally.

Hams radiate,
Procrastinate,
And don't check their Vis-warh.
They can't live to ninty-three...
Knowing less that a cee-bee.

Hams got dumb,
Where I come from,
No building and no learning,
Still licensed by the eff-cee-cee...
Doing what comes naturally.

And therefore, what, ham radio should offer more certificates? I only got one high school diploma. Would I have been better educated had I been offered three or four?

When/if that happens, you would have a point. My 1957 ARRL License Manual had 3 pages of Novice Q&A. My pre-April 15 ARRL Extra License Manual had 94 pages of Q&A. How you can believe 3 equals 94 is beyond belief.

The URL wrapped into two lines. To open the page, you'll have to copy both sections of the URL into the location block and then hit return (enter).

However, to save you some time, I'll give you a brief review. The page contains a letter from John S. Rippey (W3ULS), to the FCC. The letter is supposed to be about "re-allocation of certain sub-bands," but the author distracts from that with constant references to various license classes. For example, he ends the letter with, "...the Novice, Tech Plus, etc. licenses are hybrids of dubious value that deserve to be put out of their misery."

Obviously, since the letter was dated January 2001, Rippey doesn't make much of an effort to keep up with current events - the Novice and Tech Plus licenses were dropped from the current license structure almost a year ago. In time, even the various sub-band allocations will be dropped as the number of current license holders in those classes eventually decrease.

He also doesn't seem to know much about the old license structure either. For example, in one sentence, he refers to "Technician Plus licensees as well as Technician licensees who have passed the 5wpm code requirement." That is the same thing - a Technicion Plus is a Technician that has passed the 5wpm code requirement.

The idea of Novice sub-band reallocation is sound, but, in my opinion, it is a bit premature (there are still too many people using those sub-bands). Perhaps in another year or two.

I've always been a MUGWUMP on the subject of retining the CW exam
speeds...but it seems to me that you, Ed, are neglecting the facts.
There is no longer a Novice Class... because when there was, there were
few applicants...BUT Another way of looking at it: IS that now many
Generals are really at the old Novice level! CW wise the General
license is really a Novice license with a different name and a few more
multiple choice fixed Q & As. It is like the reading groups in first
grade. Naturally the teachers don't want to kill the kids self-esteem
or give them swelled heads by calling the groups "The Slow Readers'
Group" and "The Fact Readers' Group", so they call them "The Bluebird
Team" and The Owl Team" or whatever. The Extra Class license might
actually be thought of as the old Advanced class license with a
different name. That is why I believe that we need more classes of

license, in order to really provide for the technical diversity within the hobby. We need a even easier entry class for really new novices (small n) and we need more expert classes for the more really technically advanced hams. We need kindergartens and high schools....Head starts and advanced classes...Very few people, who have been trained to be educators, would deny that.

If you are a chef, then all you may need to know is that the chicken
got cooked to your liking...BUT if you are a scientist or engineer you
need to know a lot more; and if you are afraid that the chicken was not
cooked well enough to kill the bacteria in it, you work with scientists
and engineers; You don't care much about what a chef might think
because he doesn't understand the MECHANISM, nor the cause and effect
of the groth of bacteria populations in what might be pockets of
relatively raw chicken. The chef might not even be able to smell or
taste bad chicken that is dangerously tainted. Worse he might attempt
to cover up bad chicken with gravies that hide the rotten, stinking

chicken and make it profitable to do so.

Some of the "experts" who talk about what are considered RF hazard levels are no more scientific than old grandmothers who think that chicken soup will cure any illness. True, chicken soup might have some healthy benefits for some minor ailments...but the old grannys who make it don't know much about the spread of bacteria that exists within humans and certainly aren't aware of the latest reasearch about the AIDS virus. Chicken soup might just have a psychological beneficial effect on some humans...others might be better off with mock clam chowder or mock turtle soup....or some real Johnny Walker.

> we will be designing humans soon!)

When you design electrical devices there are certain intrinsic conditions that must be delt with. There are physical limitations that involve the actual fabrication of resistors, conductors, insulators, etc. (although I admit the human body is much more complex than an electrical resistance path)...
BUT
WE need to know the mechanism by which hazards can be hazardous before we can determine what the safe levels are...just like we need Ohm's Law before we can design for appropriate resistances, voltages and currents that can make a circuit function as we intend it to.
True, we can not reengineer humans yet...although genetic manipulation may not be out of the question in the far future...BUT we need to design RF radiating equipments (including cell-phones and Ham HTs) so that they are safe for use by humans IF this is possible. On the down side, it might not be possible....just like it has not been possible to manufacture a truly safe cigarette that is still a cigarette. We can not just think of the human body as a dummy load for RF...nor can we just think of the overall thermal effects on the body, without knowing the mechanisms that have dangerous propensities. Considering only thermal effects will definately prove to be a gross error. If the RF can be more consentrated on vulnerable parts of the human body at UHF than at VHF then this would not be a consideration if only thermal effects on the entire body are all that is being considered. It is a known fact that heat is generated when RF causes electrons in certain molecules to be agitated. (Heat is actually defined as electron

agitation) BUT the effects of agitating electrons in the material that constitutes human tissue of various functions is poorly understood. What levels, at what frequencies can cause genetic damage? What can cause or accelerate cancerous malignancies? What tissues are most vulnerable? Can some individuals be more at risk than others? All must be considered before setting any safe radiation level standards. Although the research continues, we have been permitted to work with standards that may be considered conservatively safe by some "grannys"...BUT not by W2ILP.

I admit that I dunno at this point in time... nor does N9GL. Let us leave it at that.

Jim:

If there were such a thing as an "Extra Cum Laude," then I'm the kind of person who would just go out and achieve it -- without whining about it. As a recent "non-traditional" college graduate, I achieved Summa Cum Laude status by making a diligent effort to ensure that I did fall within the parameters of that lofty status. Now, nobody can take that achievement away from me -- just like they can't take my Pre-Restructuring Extra-class achievement away from me!

My question for you is -- what do you have against striving to achieve a lofty goal?

T. L.:

Well, to some, it's a whined about as a "worthless, outdated hazing ritual of high-speed code testing." To others, the relatively slow (even at 20 WPM) code tests provided the incentive to learn and master a useful communications skill in return for increased operating privileges. I guess your mileage varies depending on your attitude toward being a fully-capable radio communications hobbyist. If all you want to pursue is the easy stuff, then code testing would make you, well, testy! It's too bad the requirements easily achieved by tens of thousands of people from all walks of life were such a problem for you, if that's the case.

Scales don't tip until the weight on one side exceeds the weight on the other side. There are still far greater numbers of code tested hams than non-code tested hams. If you said that the scales are tipping, you are wrong. Why couldn't you just say that there is a good growth rate in the ____ class of license?

Having been thru two earthquakes including one with an epicenter in metro St. Louis in my days there, there is nothing in this world more terrifying. Earthquakes in the mid-Continent are not the localized (however severe) California type but cover vast areas. It is said that the big one in the early 19th century rang the church bells in Washington DC with aftershocks for months. Should another New Madrid occur, you can write off St. Louis, Memphis, and pretty much everything in between.

Two questions:

1. Dick, if you were involved in planning just what did the plan entail? How do you plan for Swampeast Missouri to essentially disappear?

2. For numbers alone, the amateur service cannot be planned for in any disaster scenario. The history is that we fortuitously appear like the gnomes in the night. The most obvious is H&W traffic which sort of implies a National Traffic System if things are not going to turn into a cluster. What sort of shape is it in? In Guatemala many years ago, the H&W traffic was flown into New Orleans on Pan Am and NTS from there. Still possible? Good solution for the remaining amateurs in Guatemala had better things to do and a long-term working relationship with the Red Cross was put into use to do H&W. The question is whether anyone at any level has even the barest outline of a sketch to handle anything like this?

I just got back into amateur radio after a three to four year layoff. The language has changed a bit since I was last active.

For instance, where did saying "QSL" or "Contact" come from?

Q codes are for CW, not phone. Saying QSL is the same as saying 10-4 to my ears.

Contact? I have no idea where this could have come from. The traditional method of injecting oneself into a conversation (which is rude if the conversation is between two hams), is to announce your callsign. If the participants want company, they will invite you into the conversation. If not, you will be acknowledged as the next in line for the frequency when their conversation is complete.

I'm not stupid enough to think that anyone cares about my opinion, so there's no need to be offended. It's just that even I, an ex-CBer during the seventies, can see some of the CB SSB language infiltrating the ham lexicon/culture.

Does it matter? Not really, but it does seem to make us seem a little less intelligent. After all, the rules for telephony state that we are to use plain language, not codes or ciphers. But then again, that's just my opinion.

Didn't say I couldn't Lennie. Just pointing out that you have
been lying AGAIN. You have (recently) stated you don't do that kind of
thing, yet you have been doing it to me for two years now and you
started the "Jelly" comments on Fred. Fred did NOT make any
such "endearments" to you, but you certainly have tried to rip him a
new one.

Of course, I am sure if you keep it up and then start getting it
in return from him, you will, as you have with me, claim "victim"
status and then begin your own rhetorical abuses.

You always do.

Which doesn't mean they don't have some influence on how the readers of them view attitudes within ham radio. And I suspect the attitude toward newcomers you express here is not completely absent from your in-person behavior. It's hard for anyone to completely compartmentalize their feelings.

> As far as treating people is concerned, I must advise you that

The only thing I've ever expressed contempt for is behavior that exhibits a lack of basic human respect for others. I can't help it if you find that "smug" and "arrogant." Frankly, I think those words far better reflect your attitudes than mine. As for your other contacts with ARRL HQ, I don't know the specifics. But since your reaction is precisely opposite from the one most HQ visitors display, I suspect your feelings have more to do with your prejudicial view of ARRL than with anything actually done by any HQ staff person.

I'll be more than glad to relate that information as soon as YOU
provide (as was requested MONTHS ago) names and other information of
verifyable sources that can validate YOUR many claims.

And more than one person here knows the name of the company...even
has my corporate addresses and phone numbers. You gonna call and chat,
Lenni? I'll give you the 800 number if you care.

And by the way, I AM doing both. Again, unlike you, I saw that
there were a great many things that I would like to do in my life. I
may never completely master any one of them, but I will do my best to
experience as many as I can.

No excuses as to why I didn't do it, other than I didn't do it.
No "elitists" holding me back, or failed excuses.

> What is more amusing is this person's claim to once
> being a "commissioned officer" in some state militia,

The exercise of which would be a theoretical exercise.

PROVE THAT THERE WOULD BE A NEGATIVE NUMBER TODAY.

To show a period of some negative growth and say "See See!" is
foolish. That's like trying to forecast all economy growth based on
the 1930's.

>.....FCC's preferred since they are to only agency ganting amateur
>radio licenses

How do you "gant" an Amamteur license.

And why do you insist on insulting Joe Speroni by abandoning his
database to look at others when it suits you?

> ...there, wasn't that simple? Even purchasing agents can do it.

Yep...sure was...and it still proves nothing. PROVE that the
Technician Class license is the ONLY reason there is any "growth" in
the Amatuer radio service.

PROVE that there was NO other viable option or that NOTHING else
would have occured to spur changes.

We're waiting.

Larry doesn't care whether or not hams have reached a certain level of technical proficiency. He only cares about how fast they can beep. He calls them "welfare hams", but welfare implies that something tangible is taken from someone who has, and is given to someone who doesn't have. Nothing tangible has been taken from Larry, but his blurred vision doesn't see things that way.

Not in the least, Pal. Radiotelegraphy IS the basic radiocommunications mode, whether ham radio or whatever else. No other mode can be put to use with so little equipment requrements. ANY RF generator can be on-off keyed to form Morse characters. No other mode can do that. NONE. Any ham radio operator who is unable to make it work simply because he was to uninformed to cause himself to learn to be able to use it is thus unqualified by definition, as you are so fond of saying.
2meter FM is basic radio communication? On what planet?

Let me get this straight: Are you saying that just because you are happy, content, and all hunky-dorey, that there were not other hams who were vehement about losing priveleges to so-called incentive licensing? If this is the case, then you need a serious reality check.

If present trends continue the only Hams left may be Olde Fartz.
Even if there are one Megafartz of old hams what will that mean if there are no new young hams to replace them in the future???

> > Despite this narrow-mindedness, the class of license doesn't prove whether or not the holder of said license is a "real ham".

IMHO the narrow-mindered are those who only consider their own interests and could care less about the survival of Ham Radio.

> No, but it beats hell all out of any nocode qualification seen to date.

I have recently joined an e-mail group for QCWA members (or old farts as some might say). The QCWA and its chapter clubs are struggling with the problem of decreased active membership and not enough new members to replace the silent keys...just as most of the ham clubs, who are honest about it, are ready to admit. I would bet that the membership in most ARRL affiliated ham clubs is also decreasing or will soon be decreasing. Some QCWA leaders want to open up membership to all hams who have not yet met the 25 year requirement. This is not unlike the Ham leaders who have been continuing to press for simplified ham license requirements. The trouble is that such changes can only lead to further disinterest and active participation in ham radio by those whop have previously qualified. It also leads to a loss of PRIDE...even a loss of prestige for ham radio as a hobby. People who might be considering becoming hams can not be positively influenced to enter a hobby which can not retain the kind of pride it has had in the past.

The USA and world cultures are changing. In the 1950s people thought that TV would take up so much of peoples' time that they wouldn't be active in clubs and hobbies. It didn't have as much of an effect as was feared on ham radio. BUT...today there are more options for people who are interested in using technology as a hobby. Unlike TV, but like Ham Radio, The Internet and cellular phones are interactive..That is, they are two way communication systems which offer the ability to make new friends and discuss stuff with individuals and with groups

worldwide..and to get and give opinions and education about any matter that might be of interest, technical or not. Today's young techie nerds, hackers and gurus are as interested in computers as we must have been interested in Ham Radio. They think that Ham Radio is just for old farts. They might join a computer club to learn more about their opertating systems or to swap software...but they won't have any time left for a Ham Club.

My opinion is if you want ham radio to survive and to eventually interest more people you have to make it more technically educational; not easier to advance to "Extra" class. Ham Radio is far behind modern communication technology and must be advanced to the relative point where it was in 1950. To do this we need more higher level technical requirements for the higher level hams...although we still need easy entry requirements to help get youngsters started. This is in opposition to the present ARRL policy. The ARRL leaders can not seem to get it into their heads that to attract new members and to keep some present hams active...you have to give some PRIDE back to all Hams, by encouraging those who want to, and can qualify for advanced modern technical ham ability (as real hams, if I may), to take more and better high level technical exams. Forget high speed CW, but make high technology the mark of a real Ham....If not the goal...If not just the BASIS anmd PURPOSE of the whole hobby!

Hams need more license classes.

that then forces the FCC to decide to terminate ham radio because it is
out of control.

Wonder how much money 75 meters will bring?

Yep...
We have discussed Segal's "The Amateur's Code" here before. It does
not mention CW, BUT the spirit of it is to say that a real ham is
technically qualified to be: -
PROGRESSIVE...with knowledge abreast of science...

How are we proving that real hams must be "abreast of science" by
reducing technical requirements for Extra class. by eliminating
Advanced Class, and by not making ham technology compatible with modern
electronic communication technologies?

> > No, but it beats hell all out of any nocode qualification seen to

<Code Quick probably works well at 5wpm. I could be wrong, but seems to me, it wouldn't work above about 15wpm and would actually limit one's maximum code speed.>

Actually, many of the Code Quick users reported passing the 13wpm and 20wpm Morse Code exams before last year's restructuring. Also, many of the satisfied Code Quick users include people who ran into roadblocks using more conventional methods.

I will personally try moving up to faster Morse Code speeds. Maybe CW will allow me to work the 80m band, as SSB seems to be heavily distorted and/or noise-infested.

Which "technical requirements for Extra class" have been reduced?

Answer: None.

If you can't debate the issues on facts, I suppose it's OK for
you to make up arguments to suit your agenda, but of course
you risk being exposed as an insubstantial pompous windbag.

Blow on, Robert.

Me too. But I just can't think of anything that would be gained by it -
other than being able to say 'I'm better than you are'. I know that's
the sort of thing that appeals to some people. I just don't think that
government needs to get into that kind of business. The FCC administers
radio spectrum, not academic programs.

> My question for you is -- what do you have against striving to
> achieve a lofty goal?

What indication do you have that I don't strive to achieve lofty goals,
Larry?
I just don't feel obliged to demand the same thing of others that I
demand for myself. I figure I've got a better shot at achieving my
goals if I spend less time worrying about the other guy, and more time
concentrating on my own situation. Furthermore, I don't need the
government telling me what I need to do in the way of self-improvement.
I'm sorry if you do.

If they can think something like 'Clunky Clunky' when they hear a 'C'
in a word at 20wpm, they think a lot faster than I. At 20wpm, I would
consider 'Clunky Clunky' to be extremely distracting and limiting.

All you have to do is wait. Judging from the ages of most CW ops, a lot of them will be silent keys within the next ten years.

I don't think they will have a problem with Morse code use in the Cellular Service. They would only raise objections if people had to be tested on Morse code decoding before they could use a Cell phone.

I thought I heard Morse code emmanating from a cell phone while I was stranded at the Pittsburg airport earlier this week. Nice to know it was not my imagination. :-)

I think that a 2 meter HT is the simplest form of amateur
communication. And, I think there's reason for code to be a part of
amateur testing.

> What is wrong with live and let live?

There's a few things wrong with it. Foremost being that it isn't
universally applicapble.

What the hell do you expect? Ham radio has stagnated since influx of the computer era. Nothing was done to rise to the challange. The Ancient Radio Relay League insisted on keeping high-speed code testing as a measure of someone worthy to receive a license. Commercial networks upgraded to 2400, 9600, 28.8k, and 56k througout the 90s, while packet radio was stuck at a pitiful 1200 baud.

For someone who wants to pursue a career in communication technology, ham radio might serve as a springboard for that career. Even so, the drive and ambition to achieve technical knowlege will be there without the need for more license classes. Ham radio isn't for everybody.

You cannot determine that from the statistics at AH0A.

Some of the "growth" of the Technican class license consists of
code-tested licensees.

Since the April restructuring of last year, all code-tested
Tech Plus who renew are being renewed as simply "Technician". Thus
the "Technician" column now contains roughly 10% (minus attrition
and upgrades) of licensees from the old "Technician Plus" ranks.

Raise the Morse code requirement for the lower 25kHz to 100wpm?

I knew you guys would come up with some great ideas. But I think that nothing short of a federally mandated 'no lids, no kids, no space cadets' requirement would satisfy the malcontents out here.

Havent operated on the old ham bands for a couple years now. I keep the license up to date, but there are just too many idiots on the air for it to be anywhere near enjoyable any more. don`t worry. the FCC is selling them off piece by piece anyway. Ham radio has had its day, and the ARRL and FCC let it go down the drain. It is now going to die a well - deserved death, and leave us all in peace. We still have the internet, and we can easily talk round the world on it. I stopped putting up with CB pond scum years ago, and since that is what the Ham Bands are on their way to becoming, I think it derserves equal attention .....

I proved you were a phony before. This confirms it. The ILLEGAL FAGGOT KEYCLOWNS from rec.radio.cb have gotten me booted from several isps. All because I retaliate to their childish ways. Its ok for them to threaten me with physical harm, but if I say anything back they make me look like the bad guy, even some hams have sided with these criminals. I have no use for criminals. Check out my webpages of the ILLEGAL FAGGOT KEYCLOWNS. I will not stop and you can't do shit about it!

The downslide began well before the current license testing scheme was put into effect. If the bands are sold off, so be it. I'll take my entire share of the profits of such a sale down to the corner Starbucks and by myself tall caramel macchiato.

NOT! The ARRL gave up helping ham radio and improving things about two years ago. From what I see they're not planning to propose making things better in the future either. ARRL stratagy is like Outcome Based education, they don't want quality, only quantity.

Lets get **THIS** straight - You said "All it (incentive licensing did
was piss off a lot of hams who lost privileges because of it".
I was a ham who lost privileges because of it. Rather than let it piss
me off, I, a mail order General class ham, shortly made the 260
miles-one-way trip to the FCC office and came away with an Extra class.
Just as many, many other hams did.
So, Pal, you don't know what you're talking about. And that surprises
no one.

And now we've got folks who couldn't fix a squeeky wheel if their life
depended on it.

Well you can always wish. There is more and more CW activity as time
goes by, instead of less. If you were interested enough to listen you'd
know that. And lots of young people on CW as well. Yesterday I worked a
24year old CW op who had been licensed since age 13. His calsign suffix
was even "CW".
I know, that goes against your wishes but that's surely not the only
thing that goes against your wishes. Wishing just won't make it come
true. Sorry.

You couldn't be more wrong, and it is really curious how you managed to
come to that conclusion. There's littlein ham radio I enjoy more than a
CW QSO with a young ham, and his code speed is not an issueat all.

It's plain as day- you have no clue. You haven't had even a receiver on
the ham bands lately, if ever.

I know most of the members of the IEEE SCC-28, Bob; their expertise is much less like chicken soup than some of the posts in this thread, yours and mine included.

I do not believe that you are qualified to pass judgement on their expertise, nor do I believe that you know anything about their expertise than what your imagination tells you might be true.

<chicken soup analysis deleted>

> I admit that I dunno at this point in time... nor does N9GL. Let us

Can you tell us what you believe to be lacking in N9GL's CV that makes you conclude that he is not qualified to make the statements that you "dunno?" If it helps, see:

http://www.arrl.org/rfsafety/index.html
http://www.arrl.org/rfsafety/whoweare.html

and for Mr Lapin personally, see:

Cecil is not the one remaking technology, Dick; the technological world is evolving. IMHO, the very survival of our Service could depend on the number of hams who learn enough about new technology to stay relevant. Our survival may also depend on the number of hams who say "***NO***!!!" to learning that new technology, too.

Riley Hollingsworth has been telling hams that we should not let Amateur Radio become obsolete under our watch. What do you think he means by that and why do you think he is saying that to his fellow hams?

If he had a license he is a HAM not a CB'er
Frankly Freebanders are like the Hams of old. If you look at the FCC
enforcement logs The Hams are out of control and need enforcement while
Freebanders are mature and working to improver thier knowledge, save lives,
promote freedom and democracy, and gernerally aid and improve the geneneral
welfare or thier comunities.

I have not been limited by the number of license classes in the ARS; the things I have done within Amateur Radio have exceeded the scope of any exam I have ever taken. Do you believe that I am not meeting the basis and purpose of ham radio?

> > You want that type of license=respect, then get a college

I would hold a ham who had a demonstrated ability to construct his or her own equipment over a BSEE for most electronics technician jobs. I would hold an experienced electronics technician over such a ham, though.

Are you now proposing that hams be tested on their ability to build their own equipment from scratch?

> <snip> My answer is by drastically changing their attitudes.

> past)...BUT let it not be too late to attract new hams into our ranks
> by offering more modern challenging exams that can not only give more
> pride but can prove more value.

If the unlimited challenges of being permitted to do all the things you feel hams "must" be tested for is not enough, you vision of chaning the attitudes of all these potential newcomers is just a pipe dream.

> It is virtually unused!

Part of the reason, Hans, is that amateur stations within 80 km of an AMTS station cannot operate without the express permission of the AMTS station. Some have been willing to grant such permission; others routinely deny it. With major holes in what was hoped would be reasonably seamless backbones, it is a chicken-egg situation.

ARRL HQ has a staff of about 120 people. Mendelsohn is not an HQ staffer, btw; your dealings with him have been in his role as a volunteer. What percentage of those 120 people who work at HQ have you actually has personal contact with?

The Novice test I took had no questions on antennas, propagation, feed lines, tubes,... well, the list goes on for quite a bit.

If you are saying that a test that requires an applicant to study over 1200 questions is not as "qualifying" as that dirt-simple Novice test I took, you are incorrect.

> You know the appropriate descriptive word - and it isn't bullfeathers.

I will simply use the word incorrect and let it go at that.

Yet, in spie of that fundamental "basicness", that great simplicity,
no one in the commercial sector puts ANY value o its use in an
emergency. Indeed, it has been abondoned by just about all
except some ham use for enjoyment.

>Any ham
>radio operator who is unable to make it work simply because he was to
>uninformed to cause himself to learn to be able to use it is thus
>unqualified by definition, as you are so fond of saying.

In your not so humble opinion perhaps, but other than
yourself and a handful of others that think like you, there
is no one saying a non-code ham is thus unqualified. Point
us to even ONE credible proponent, other than some hams,
of CW as an emergency mode.

> 2meter FM is basic radio communication? On what planet?

Given the ease and common place existence of a
preponderance of 2m FM, it is, indeed a basic mode today.

Cheers,
Bill K2UNK

Would you mind filling me in as to what it is I wished for? I made an
observation. I don't recall making any wishes.

Vince, be pragmatic. If it means the survival of the ARS, then we do
the quantity thing, and let Riley handle the guys that think they own
the ARS. If there's not a real breakthrough on the actuarial tables
soon, the ARS is in trouble.

Tracy, pretend for a moment that I know nothing of the ARRL and the ARS.
Now explain your position WRT the ARRL, and identify the organization
that you believe to be the solution, and state why.

Thanks, Brian

Well, gooooooood. Then you can pick yerself one of those spiffy KC
calls for a vanity call, once you wait the appropriate length of time.
Or you can go for one of Mike Deignan's multiple callsigns. They
were turned in sooner.

Anyhow, its been great hearing from you again.

So now one needs to be an expert in scaleology to be able to state that the numbers of coded hams are dropping and the number of no-coders is increasing. This must mean that the Postmaster General knows more about ham radio than you.

Major sumptin.

But nothing suprises me anymore. Why just the other day, Dick admitted that CW was doomed without the government forced testing. Seems it isn't worthwhile enough to learn it on its own merits. After all those years of claiming PEEU.

I just wish these other guys would come clean and quit the smokescreens and diversions.

I couldn;t agree more myself. while I won;t disagree that there are some

bad eggs in both CB and Amateur. the are not ALL bad. And improvements can be made if you go about it in the right way.

I am in the proccess of getting my ticket. and I feel that I am a responsible and LEGAL CB operator and I will continue to be courtious and respectfull on the amateur bands when I finally have the priviledge to use them. I have friends here in town that are hams, sometimes I go over to their house for coffee and they share their wisdom and experiance with me. I just hope that someday I can do the same with a new radio operator.

Good Job Brenda Ann ... i have also been a ham since 1978 code never interested me at all i passed every element of the theory more than once in hopes that one day i would get my speed up to 12 wpm ... well i never did study anymore code and now thanxs to the fcc i am a general. and the same as you i know more electronic theory and amatuer operating principles etc than many extra, advanced and general class hams who have been able to pass the code portion. for what its worth.

Gee, you were strangely absent when I was set upon by the virulent
pro-coders for saying there was no one on the novice subbands 13 years
ago. Oh, lemme see, "at least 10 years, (but not more than 12 years)."
That must splain it.

It's true look at your own foul and filthy mouth!
Ham's always use foul language and filthy talk on the radio just like they
do on this newsgroup. Freebanders know better. Freebanders are mature and
can express themselves without spewing forth filthy language.

to higher
> speeds are pretty important.

Of course. But the whole assumption that Morse must be learned slow and
the speed built up is a faulty one. Koch showed that as early as 1936.
He was able to get groups of people from no Morse at all to 12 wpm in
under 20 hours.
>

We are.

> They should be forming slow-code
> nets, and looking for those 5 wpm CQs and giving them a nice QSO and some
> affirmation that this is a fun mode that will bring value and enjoyment to
> their use of it.

We are.

>Where are these things?

All over the place. But you have to know where to look.

>Has ARRL done them?

NO. Not in many many years. The closest thing to it is the slow speed NTS nets and W1AW code practice, both of which are excellent. But they are about the limit.

> Has FISTS?

Yep - for years. Try a CQ on the FISTS freqs at 5 wpm and see what happens.

> Have you?

For the past 33 years.

> All I see by those who may think they are "defending" Morse code is
> posturing and name calling.

Some of us are trying to combat false information with facts.

> IMHO, taking real steps to get people from 5 wpm
> to what you term "journeyman" levels is more valuable than the use of the term
> "bleating cattle" on rrap.

How about "electronic paintball wars"? ;-)
>

A QRP CW signal usually won't get through in the same passband
being occupied by dozens of high-power phone signals. CW is an
extraordinarily robust mode, but it is not infallible.

Jason:

Just as well; you can't use anything BUT CW in the 80-meter band
here in North America! BTW -- SSB *is* heavily distorted and/or
noise infested on all HF bands!

Ed:

More than enough to give me a generally negative impression of
the attitude of the ARRL HQ staff toward members -- and that's
all that matters.

Ed:

As well you should be. My own standard of what would be a
significant "contribution" to the ARS would not come close to
requiring the publication of an article in QST. Or 73, even! I'd
settle for new hams that can read the owner's manuals that
come with their off-the-shelf appliances, and can figure out for
themselves how to store a PL tone in a memory channel, without
needing someone else to show them which button to push,
how long to hold it, and what to do afterwards. As far as I'm
concerned, you could have rested on your laurels permanently
after publishing your first article, but you didn't. I wish we had
more hams like you, and no more of the kind we're getting with
the dumbing-down of licensing requirements.

Ed:

I believe that what was in place prior to April 15, 2000 was just about perfect. I would have been quite willing to change that structure in accordance with my proposed structure stated in my comments to the FCC on the Restructuring NPRM: eliminate the Novice class, alter the written tests slightly, and give 100% of HF voice privileges to the 12/13 WPM Advanced class license, leaving the CW DX windows and the 1x2 and 2x1 callsigns as the only remaining incentives with a 20 WPM code test attached to them.

>>My question for you is -- what do you have against striving to
>>achieve a lofty goal?
>
>Do you see everything through the filter of striving, or a lack thereof?

An even better question would be why do you see nothing through such a "filter?" What in the bloody blue blazes is wrong with establishing and maintaining a set of reasonable requirements, geared toward obtaining practical communications skills, to be achieved in order to attain valuable operating privileges? Do you really think the clients of the Welfare State will flock to the ARRL en masse once the bar is dropped to the ground? The truth is, a lot of those foot draggers will trip over it anyway, so you may as well do what you want to do, and bury it totally! Then you'll have a perfectly level, politically correct playing field!

Not so at all. I agree with that statement, I don't agree that
anyone needs to be knowledgeable in the USE of morse
to be considered accomplished in the radio arts (be it
technically or on an operational basis). Indeed, for Dick's

claim to be valid one would then want to question why
engineering schools have never required even a working knowledge
of the morse code itself before graduating engineers.

>Why are we not
>surprised? Of course you wouldn't see any reason for anyone to be able
>to use it.

You misread once again. I see no reason to REQUIRE anyone
to be able to use it. I have absolutely no problem with anyone
using it as their personal choice.

> Poetic justice would be served if you were to find yourself in dire
>circumstances where your voice mode just couldn't quite cut the mustard,
>and you were left with nothing but a PTT to key as CW.....

A yes, the good old morse myth #27 once again. If the need
was of any consequence, then why doesn't the military
require it anymore?

Cheers,
Bill K2UNK

I've heard enough. Most of it is weather reports, health problems, and/or "RIG HR IS..., ANT HR IS..." which I couldn't care any less about. DX is nothing more than a callsign and signal report exchange, with no meaningful conversations because so many other vultures want their precious wallpaper. If I'd want to turn a young person off to ham radio, all I have to do is turn my receiver on, and not say a word. The average QSO speaks for itself.

Yep, on your and my planet, Bill, but not on Dick's planet. Signals
from his planet takes 75 years to get here. That's why he thinks
they are still using nothing but Morse code.

I have copies of some old first person accounts from survivors of the
1811-1812 series that lasted from Dec 16 through March. Several were
major quakes at 8.0 or higher. That must have been quite a ride.

Earthquakes in the mid-Continent are not the localized
> (however severe) California type but cover vast areas. It is said that
> the big one in the early 19th century rang the church bells in Washington
> DC with aftershocks for months.

Yep, the underlying substructure throughout the Midwest and East is
quite different from California. The Midwest was once an ocean floor and
the limestone rock is deep and extends most everywhere. It carries the
shock waves much more efficiently than the West Coast substructure. The
1811 New Madrid shake rang church bells in Boston and cracked chimney in
DC and South Carolina.
BTW, I heard on TV a week or so ago that there was a 4.0, I believe it
was, in New York City. Most people there don't know it, but they, too
have a serious fault system and are at substantial seismic risk.

Should another New Madrid occur, you can
> write off St. Louis, Memphis, and pretty much everything in between.
>
> Two questions:
>
> 1. Dick, if you were involved in planning just what did the plan entail?

> How do you plan for Swampeast Missouri to essentially disappear?

It's not an easy one, fer sure. The conclusion was soon reached that there will be nothing in the affected region that could be depended upon to function as a normal asset, including any surviving critical personnel who would be faced with the same disaster conditions as everyone else, with their families, homes and pesonal affairs to attend to. So whatever relief happens will be assumed to come from the outside. Initial reports of what happend where, to whom and with what resulting needs and demands in what quantities will be crucial to timely dispatch of effective relief efforts. Frankly, the planning solution must be much more general than specific for those very reasons.

BTW, I read once that there are 100,000 masonary buildings in St.Louis that are earthqhuake risks. Seemed a high number to me, but there are still no codes for construction there that mandate sufficient hardening. Memphis is in even worse condition, that entire city is built on a mudflat several hundred feet deep which will liquify when the shaking starts, and what doesn't disintegrate will sink in the muck.

> 2. For numbers alone, the amateur service cannot be planned for in any
> disaster scenario. The history is that we fortuitously appear like the
> gnomes in the night.

Exactly. And the fact that hams are so widely dispersed throughout the populace, with stations which generally can easily be utilized apart from the normal unmbilicle of the gridded infrastructure makes them vitally obvious first/early response communications assets. The instant need post-event is what hams will be able to provide-the who, what, where, when, how much and why that is always the hanging question and without which no efficient, well planned response by relief columns can be intiated. Effective respoonse can be begun only after sufficient accurate information is received that can be worked up onto a set of opertional plans. Information is vital as to surviving roads, bridges, airport runways, hospitals- will field hospitals be needed, etc etc. LOTS of details surface. Of course agency information gathering overflights from outside will begin as soon as possible, but even these need preliminary information to work with.

> The most obvious is H&W traffic which sort of
> implies a National Traffic System if things are not going to turn into a
> cluster. What sort of shape is it in?

I'm not up to speed these days on much of this since I've been retired for nearly 7 years now, and am really out of the loop. I wasn't a bit unhappy to leave all that to another generation.
Maybe that's why I advocate not abandoning CW as an actual communications asset, kept as a backup for the times when other modes can't do the job.It's no big deal to switch from SSB to CW when needed if operators are capable, and there can always be an additional CW circuit set up if needed, that happens at times as a routine matter. Of course the first choice would be some good digital mode, maybe PACTOR,

but the overhead needed is such that many hams who don't use it aren't equipped. It can't be depended upon tobe available when and where needed.
There is not a strict necessity to have a full CW practice net, at least for those who are familiar with traffic handling, and that's one thing I did a bunch in my years with MHP. It would be nice if most hams who see this as something beyond 'just a hobby' would get interested enough to work on that side of things a bit. And I DON'T mean only CW.

In Guatemala many years ago, the
> H&W traffic was flown into New Orleans on Pan Am and NTS from there.
> Still possible?

I'd expect so. For sure the Internet/email will play into any future such activity, but of course no one knows how it would be affected, either.

Good solution for the remaining amateurs in Guatemala had
> better things to do and a long-term working relationship with the Red
> Cross was put into use to do H&W. The question is whether anyone at any
> level has even the barest outline of a sketch to handle anything like
> this?

Again, I'm not current on the disaster relief comm. scene, but the last I knew ARC had ham volunteers being sent on most every disaster team package they sent out. I knew some hams from Springfield who went on Hurricane Hugo.

ED just what are you saying? I already know, and have known for a long
time, how a digitized signal process works, where it samples an analog
wave, digitizes it and later reconstitutes it as analog once again, sans
noise. That's not new, nor is understanding the process equivalent to
rocket science.
BUT--- if, like Cecil, you're telling me that Riley and his buddy Dale
Hatfield insist that I and any serious percentage of ham radio licensees
must become digital designers just to assure the survival of the ARS,
you might as well go ahead and pass the word to them that they can begin
the Big Shutdown anytime now. It ain't gonna happen. No such educational
revolution is in the offing nor shall it ever be.
I for one am damn tired of being told what we "must" do to insure ham
radio's survival, all the while the written tests are made dead-easy to
pass without any effective learning of the material being absorbed by
the entrant. And that's not just my opinion, rather dead on fact as
evidenced by so many so clueless who aren't even bashful about admitting
it publicly.

The whole situation looks more and more like a scheme to ease us out of
our most commercially valuable spectrum segments, and that is something

that I consider to be inevitable anyway. They WILL be taken from us as commercial demand for them reaches critical mass, as has always been done, and logically so. But with hams having become so dumbed down they'll have the perfect rejoinder to our protestations- "We told you if you'all didn't become rocket scientists you'd lose frequencies...."

Dick W0EX

I think he is right Dick. Incentive licensing did anger a lot of hams.
I was one of them. I remember talking to lots of hams who thought as I
did about the unfairness of removing privileges once granted. I
finally used a Bash book to memorize my way to an Advanced, but I was
too lazy to get my speed up for the Extra. (I was not a CW buff at the
time.) Ironically now that I do work all CW, my Advanced is useless...

Unless you intend to leave out the lay people, it is unrealistic to
believe that average hams can keep up with current technology to the
extent that they can advance the state of the art, or be of any value
to the military. And if they can't do those things, what good are they
to the government (as they once were)...

>survival may also depend on the number of hams who say "***NO***!!!" to

These non-technical hams just might save the hobby by providing
emergency communications, something that is still valuable to the
government...

>Radio become obsolete under our watch.

Unfortunately Riley has been trying to get us to stop fighting amongst
ourselves and to stop profaning the airwaves. Technical stuff seems to
be a secondary problem for him these days..

No. As long as he doesn't get down below .25 and cause everyone down
there to have to stumble over him.
Did you miss the point earlier? I can't see authorizing nocoders to
work CW without any training in code whatver, and that's why. It's
strange so many of you seem willing to overlook that.

Maybe it's the winter season, but there is a lot of CW on these days. I don't know about the Novice segment, when I tune through there it's vacant, so I don't hang around.
Yes, I clearly remember the 40 meter novice band in the spring of '57. My old BC454, I think it was, heard most of them together at any dial setting, and from that experience I learned to dig a single signal out of the bedlam, a valuable skill that I still have to this day.

Ok, so it did piss off a goodly number of hams. He said that was "all
it did" and that clearly is false. At the beginning of Incentive
Licensing there were around 4,000 Extra class hams. Ten years later
there were ten times that many.

BS, I was there too, remember? The big bitch was about the "donald
duck" sounding audio and the fact that rigs of the day drifted so much
that keepinga station tuned in was near impossible as compared to the
"broadcast quality"of AM and the absense of drift-caused problems.

> Progress happens. Time marches on. Ostriches bury their heads

Now, let's back up in time to when the Generals *got* privileges they had
not worked for, when they were given phone privileges on 75 and 20 which
were formerly restricted to Class A operators. No exam, no
operating/license time restriction, no nothing - just fire up and operate.

Never seem to read much about that end of the stick, do we?

1952, I believe..... I've done quite a bit of research into the changes in
Amateur licensing over the years... some big changes in 1924,1928, 1934,
1952,1967-69, 1990, 2000 (dates may not be 'right on' the money, but then
many of the changes were phased in over a period of time.)

Hacker Crossed Police Wires
Suspect Arrested At Scene Of Ambulance Call
BURNSVILLE, Minn., 6:13 p.m. CST February 6, 2001 -- Police have pulled the plug on a police radio hacker.

Hacking Over And Out

Police said Tuesday that a 31-year-old ham radio operator in Burnsville has been broadcasting on police radios around the Twin Cities for nearly two years.

The suspect was spotted near the scene of an ambulance call Sunday. Authorities said that he might have been transmitting the call on their frequency from his car.

"Our frequency is aired over another frequency, thus severely hampering communications on both frequencies," Capt. Dan Johnson said.

That doesn't prove anything. How many of those Extras weren't even licensed when the incentive licensing scheme was put into place? How many hams dropped out of ham radio altogether because the felt the ARRL screwed them?

Do you remember the derogatory remarks about the "Single Sidewinders",
the jamming, and the open hostility? I remember some of the hams at the
time saying SSB was the work of the Devil and they would never use it.
During every time of progress, there are always the lazy laggards.

Yep, and history proves it to be true every time. There's a book out now
entitled, "The End of Time". It suggests that time doesn't even exist and
all we are seeing is change.

I was listening to 80 meters last night. The only CW I heard was a pile-up on 3.505Mhz. There's a bit more activity during a contest, but I get bored with those after about a half-hour.

I have not seen a single example here where your college-learned technique has changed the mind of anyone on whom you have used it. Have you actually seen it work? You seem reasonably intelligent; perhaps you could choose a technique that does not "slowly" sink in.

Is there any way we can tell whether you are deliberately using this technique, as opposed to just being in your own lunatic fringe?

Yep, it was a common educational technique in the early 60's. The
purpose was to expose the illogic of one side by adopting the same
illogic on the other side.

> Is there any way we can tell whether you are deliberately using this
> technique, as opposed to just being in your own lunatic fringe?

If it's not obvious, I usually provide a smiley face.

I believe you, Larry, but I am curious -- how many was it? You made a pretty power blanket condemnation of a group of people and I am just wondering about your sample size.

A single high-powered phone signal won't get through in a passband occupied
by "dozens" of high-pass phone signals, either, Larry.

Okay, as long as we all agree that we are discussing what "might" happen.

Did your comments or reply comments to the FCC suggest that a minimum code speed should be allowed in the lower 25 kHz of the band, or is that a new requirement you believe should be put on the plate?

Welcome back. You are correct that the shorthand Q-codes originated for CW but have also been used extensively on phone for at least the 30 years I've been licensed.

You may use "who is calling" if you wish...I prefer the shorter QRZ?

You may say "I have received/have you received my transmission"...but QSL is certainly shorter and easier...especially in a contest.

If the Q-codes offend your ears, don't use them...simple as that.

QSL??

A little weak on the details, isn't it? For example, not one mention of the suspect's name. I wonder if this guy was a real ham, or a guy they just tagged a ham because he used a radio.

No I did not. I was confident that there was enough common sense left
at FCC for them to know better than to do what they did. Silly me, I was
wrong.

Wake up, Ed. I'm saying that no one should be allowed on the lower 25kc
(actually anywhere on the CW segments) unless he has learned to work
Morse code, and that knowledge tested at licensing. Nocoders mucking
around in the CW segments doing what they should do with a code practice
oscillator and W1AW code practice won't cut it.

When FCC gets around to repartitioning the bands there should be a
CW-only segment that requires a CW test to use.

Digital should get its own segment, since digital and W do not mix that
well. And analog voice should get its own.

The same place that other slang comes from, Ed. Years ago, we had very different meanings for "cool," "gay," "bad," and a long list of other slang words used in our everyday language. Since everyday language continuously evolves, it is a little unrealistic to expect radio language to remain static. In fact, I'm fairly sure you were using some words four years ago that hams didn't use twenty years ago.

> [snip] After all, the rules for telephony
> state that we are to use plain language,

But for anyone who uses a ham radio, QSL is about as plain language as it gets. And, the last time I checked, "contact" was in the english dictionary.

There's always controversy on the bands, and today is no exception.
And I see there were trolls like you even in those days.

> During every time of progress, there are always the lazy laggards.

Much more factually, most hams don't wish to devote their passtime to
continually reinventing communications with the "mode of the week" sort
of nonsense seen in your circle. The fact is that history is littered
with "better ideas" that didn't make the cut. Humans are above all else
practical. If we have no pressing need for optimized highest throughput
methods with which to conduct our communications during times mostly
devoted to relaxed recreation, it does no good to browbeat us into your
personal point of view. Even if you really believe you've solved the
world's communications problems.
Evolution takes place at its own speed, and pushing and shoving does
nothing but help to impede it.

Come on, Ed, surely you know more about the ARS than that. The day when regulators can convince themselves that we have no value as a real operational communications asset is the day when our allocations are on the market for sure.

Nope, the alleged perp is a licensed ham, licensed for about five
years. He has not yet been formally charged, so there is no mention of
his name in printed news reports, although his name was mentioned on at
least one radio report. This guy has been at it for over a year,
faking "officer down" calls, cross-linking different police and sheriff
services, and similar crap. Technically smart, and has been able to
avoid being located by being mobile -- he got caught because an officer
noticed his vehicle antenna at the scene of a false-alarm ambulance
call. He has reportedly admitted everything to the cops.

I think that Dick is right. When I got my General in 1959 most hams probably thought like me: Why put in a lot of extra work for an Extra ticket when it didn't get you much extra. But when Incentive Licensing came along, many thousands of hams did go ahead and get their Extra who wouldn't normally have done so without the added frequency incentive. Some like me grumbled about it and some like Dick upgraded. There's no doubt that Dick's method is the best way to go. However the unfairness of the situation doesn't change...

>How many hams dropped out of ham radio altogether because
> the felt the ARRL screwed them?

I remember that lots of hams threatened to quit the ARRL over Incentive Licensing, but only someone with membership data would know if a large number of hams actually did. Ed? I personally don't know of a single ham who actually quit the hobby as a result of Incentive Licensing. Grumbling may be silly, but quitting would be real dumb... :-)

You seem to have forgotten something along the way here Dick. Follow
the thread back a ways and re-read what I have written to you. Read
only what it says. There is no hidden text between any of the lines.
We have been discussing operating at 5 WPM in the lower 25.

Thanks and 73,

Do you feel that CW should be banned from those segments? In the US it currently is authorized on all ham frequencies, except perhaps 219MHz.

Or should we continue the long-standing gentlemens agreement that CW operators use the bottom portions of most bands, even though they legally can operate Morse from the top to bottom of each band. I think it's interesting that most countries, except the US, do not chop the bands up into mode-specific segments, but rather let dynamic "market forces" of the hams themselves determine how much gets "allocated" for each mode.

Fine, just contact KD6JG or W6MJN and ask them. They don't
know I am using them as references so they aren't prompted by
me. Want some magazine article references? Go to HAM
RADIO magazine indexes (there's at least one web site for them
if you don't have index issues) and read the articles. You might
learn something from them. Note: Check the Masthead for HR
to see if I've been listed as an Associate Editor. You need some
industry experience? Check with personnel departments at
Rocketdyne Division of Boeing (it was of Rockwell International
when I worked there), Teledyne Electronics of Newbury Park,
CA, General Electric Co. past records of RCA Corporation,
Electromagnetic and Aviation Systems Division, Van Nuys, CA,
Hughes Aircraft Co. Missle Systems Division of Canoga Park,
CA, and Hughes Aircraft Co. Aviation Radar Division of El
Segundo, CA, Electro-Optical Systems division of Xerox
Corporation, Pasadena, CA. Since 1956 those corporate
entities have undergone some name and location changes so
be patient. I think John Memmen of Teledyne is SK (?) but
Harry Terraneau should be still alive...both are/were licensed
radio amateurs. Micro-Radionics Inc., of Van Nuys, CA, got
acquired by a succession of larger microwave houses but
Stan Wolf of MRI (long licensed as a ham) was my boss way
back when that was a stand-alone microwave company.

You want patent information? No problem, connect to the old
IBM patent site and do a search for my name. Only one patent
granted. You can also search the Patent Gazeteer for 1974 if
you have access to a printed copy. Want to check academic

records? OK, contact California State University at Northridge (CSUN) or University of California at Los Angeles (UCLA). You can find me listed in the Northwestern directory of the Los Angeles telephone book with the address printed with my HR bylines (anyone trying to telephone-stalk will find Pacific Bell security folks unhelpful). I am in the FCC ULS, by the way, although you keep saying I'm not. :-)

None of the above references I've listed has been created or put there by myself. Those are all third-party references. Such are impossible to forge, exaggerate, or lie about such as with some "personal" web page or vague newsgroup ramblings.

You won't like any of them and respond by "curriculum vitae" whining and bitching plus other sneering noises. :-)

> And more than one person here knows the name of the company...even
>has my corporate addresses and phone numbers. You gonna call and chat,
>Lenni? I'll give you the 800 number if you care.

Why is it so difficult to name one's employer? Company policy against it? If so, why do "more than one person" (outside the company) know it? Do you spend your employer's time "chatting with others" presumably not about company business?

> And by the way, I AM doing both.

"Both what?" Spending company time chatting about personal subjects? Spending company Internet time posting over the Internet? Naughty, naughty... :-)

>Again, unlike you, I saw that
>there were a great many things that I would like to do in my life.

Steebie baby, I've done lots of things in my life but you will never ever say they are good enough...because all you want to do, indeed are obsessed with the subject, is "get back" at someone you feel slighted your royal rank, status in the USARMCC in a newsgroup. :-)

>I may never completely master any one of them, but I will do my best to
>experience as many as I can.

For starters, try to become civil in a newsgroup. I know that is very hard, but you can do it with lots of patient hard work.

> No excuses as to why I didn't do it, other than I didn't do it.
>No "elitists" holding me back, or failed excuses.

Steebie...the main subject of this newsgroup is the Retention or Elimination of the US amateur radio license code test. That subject can be argued on its own and NO ONE need be licensed in order to discuss that part of Part 97, Title 47 CFR.

>> What is more amusing is this person's claim to once
>> being a "commissioned officer" in some state militia,
>> ostensibly as THE radio officer of an entire infantry
>> brigade...which would require at least a major rank.
>
> Acutally, it requires a Captain. But I will pass on that in the
>future the Adjutant General shall call you first before assigning TO.

A Brigade is 4 Battalions. A Battalion is 4 Companies. A
Company is 4 Platoons. A Platoon is 4 Squads of 12 men
each plus two more. A Brigade would have around 3000+
personnel. Only a Captain is THE radio officer of a Brigade?

Not in any Table of Organization of regular Army or National
Guard units I've seen. How is the "E" of TO&E? Still using
horse-mobile tube transceivers or something? :-)

>> When queried on this, said person replied he "had
>> the papers in his wallet." Apparently that is
>> "confirmation" for everyone else.
>
> Of which I offered a copy. You declined. Your loss.

You didn't post the scanned copy of it on your K4YZ
home page as requested along with all your accomplishments.
Gosh, a discharged USMC member who gets a COMMISSION
as a civilian ought to be so proud of that that they shouldn't
hesitate to Tell The World! :-)

How does one get a commission as a member of a state
army unit when they were once medically discharged from
a regular military branch? Is there some Faith Healing we
haven't heard of?

>PLEASE SEND PRIVATE E MAIL COMMENTS TO K4YZ@AOL.COM. RESPSONSES TO THE
>DEJA MAY OR MAY NOT BE RETRIEVED IN A TIMELY FASHION.

Hmmm...apparently the unnamed employer got a bit pissed at
an employee using company Internet facilities? One can only
wonder at that... :-)

Major Kelley, sir, you are just trying to ignite a flame war by
concentration on a trivial phrase of English.

My point was that the non-code-tested US amateur licensees
keep increasing in number while the code-tested US amateur
licensees are decreasing in number.

What is your dispute with that?

HAH! That's a good one! We gonna compare lobster consumption, too?
You'll win that one, I betcha. (Ayeh!)

But I was only half-joking. I really do want to see any and all lists
on this subject (promoting Morse - the mode, not the test). The ARRL
leadership has done very very little to promote the mode for many
years - now all of a sudden there's this order to do so. Please
understand that these comments come from a longtime member and QST
reader who wants to help, not just take potshots. (I recently filled
some holes in my QST collection - now I'm solid back to October, 1927.
And those are just part of the N2EY radio library).

OK, here are some ideas:

- Bandplans: The ARRL has a "considerate operator's guide", but nowhere
does it say where 5 wpm QSOs may be most easily found. The FISTS
frequencies are not mentioned at all. This is easily fixed.

- QST: The magazine is often a new ham's first contact with the ARRL,
and a resource for all hams. But when was the last time there was a QST
article on any of the following?
+ How to learn the code & how to increase your speed
+ How to adjust a key and send good code
+ Types of keys and advantages/disadvantages of each
+ How to set up a CW station and operate it
+ How to build/buy a good CW setup on a slim budget
+ In-depth product reviews of various Morse training materials and
methods
+ FISTS and other Morse-related organizations and resources

I've seen more QST articles on PSK31 in the past two years than
articles on Morse in the past 20-30 years. Of course the new modes need
to be promoted, but when decades go by with no attention to a popular
mode, there's a problem. Newcomers do not have the ability to easily
dig up articles from 30-40 years ago.

- Other ARRL publications: When I started out, there was an excellent ARRL book called "Understanding Amateur Radio". It cost half the price of a Handbook of the time, (first $2, then $2.50) and it addressed the basics of getting on the air. Some of it was reprints of QST articles that a newcomer would not have seen, but most of it was material intended to teach the basics without a lot of math. There were two versions, then it was dropped. Lots of projects but also lots of plain talk about setting up a station, operating, etc. Such a "junior Handbook" is needed now more than ever. In similar fashion, the fifty cent "Learning The Radiotelegraph Code" booklet needs a new version that doesn't cost too much. Of course the N0HFF book on the MEGS site is excellent, and it's FREE for the downloading. Maybe the ARRL could publish it?

ARRL Website: Some good info, but the list of Morse links is small and many of the best ones are notably absent or buried. Take a look at the Morse links at

http://www.callingcq.org

for some ideas. My favorites are the MEGS site (Morse Enthusiasts Group of Scotland), the AH0A site (for Morse University downloads), Dave Finley's (N1IRZ) explanation of the Koch/Farnsworth method, and of course the FISTS site. Did I find any of them from the ARRL website? Nope.

A link only costs the work to put it on the site, doesn't it?

- Things the BOD can do: It's interesting that the BOD changed the ARRL policy on S25.5 so quickly and so quietly, but that's a done deal. What bothers me is their inaction on further steps. For example, was an ARRL position on RM-10018 even discussed? To me that one is a nobrainer - just DO it! (Widen the "Novice CW bands" to General class size). Another idea is to replace the current mess of "subbands by license class" with "subbands by mode". Say, 35% Morse only, 15% digital, and 50% analog 'phone/image on each of the worldwide amateur only HF/MF ham bands. By law and by treaty, not just by "bandplan". Yes, 40 is a problem, but maybe it can be fixed AND the new subbands put in place at the same time. Why not? This is where the BOD can take the lead.

Learning and using Morse is neither difficult nor time consuming for most people IF the right methods are used. But a new or prospective ham looking at the ARRL website or QST will have a hard time getting info on how to go about it, even though such information is readily available if you know where to look.

And that's just my short list.

>(actually anywhere on the CW segments) unless he has learned to work
>Morse code, and that knowledge tested at licensing.

I'd prefer less Federal regulation not more. Gentleman's agreements have served us well in the past. The lower parts of the bands have always been used mostly for DX and that continues through today. No regulations needed. Ragchewing generally takes place above the 25 KHz line, even the Extras...

>Nocoders mucking around in the CW segments doing what they should
>do with a code practice oscillator and W1AW code practice won't cut it.

The more CW signals heard, even slow speed code practice, the less likely the FCC will see the CW area as unused band space and move the phone line down the band...

> When FCC gets around to repartitioning the bands there should be a
>CW-only segment that requires a CW test to use.

CW use is decreasing as fast as the mortality tables now. Requiring a separate test just to use it would just nail the coffin shut that much faster...

You were looking for an excuse...and nit-picked a single phrase
for a "critique" that was not on the subject.

Apparently you don't want to believe that code-tested US radio
amateurs are decreasing in number while non-code-tested
US radio amateurs are increasing in number. That trend has
been going on for years.

The "molehill" is getting bigger, bigger, bigger. The "mountain"
is eroding faster and faster. Closing one's eyes or mind won't
reverse any trend.

Why should the "unnamed employer" be concerned over a Deja mail
account, Lennie?

Nice try. Failed again.

Now back to your Geritol.

Three minutes of superficial detective work suggests the company
probably is:

Antec Corporation
11450 Technology Circle
Duluth, GA 30097
US

I see their stock is slipping since November when Bob Stanzione
announced a suspension in product shipments to their largest customer,
AT&T Broadband. Now trading around $10, after a high of $61.25 last
spring.

I never heard of anyone like that either. However, I think it would be more accurate to say that most hams originally learned what each pattern of dits and duhs meant before attempting to communicate with such an encoding scheme.

You just got done saying that his code speed made "no difference at all". Now that turns into "well, whether his code speed matters or not is a function of frequency." Evidently below .25 it's disasterous, and above .25 it's utterly inconsequential. I work above and below .25, and my radio works the same on either side of your demarcation line.

So your point is stated as being the availability of more communications assets, but you don't think that anything other than retaining proficiency testing for one of many many modes available to amateurs should be done about it?

Do you think that retaining code testing is a good way to convince regulators that Amateur Radio has value as a real communications asset is the best way to do that? Can you cite any statements by any FCC staff that support your conclusion?

Why did you require that the poster support his contention that some new hams would be making contributions by citing news articles or media releases? If you don't even require a QST article to demonstrate a contribution, don't you think it a bit extreme that you will only accept proof that makes the news.

Yes, but I wasn't born this way, Larry; my first 2 decades as a ham (or as an expired ham) contained no contributions whatsoever. And the accomplishement I have done since then were NOT the result of the tests I took. And I gotta' tell ya', Larry; when I was a 14 year old General, I was as dumbed down as they come.

> 9,531 while non-code-tested licensees increased by 13,132.

(Rest snipped for brevity)

The above analysis is not correct.

The period being analyzed is April of 2000 to December of 2000. The relevant numbers are as follows:

April 2000
Total ARS: 678,539 Technicians: 205,857 All others: 472,682

December 2000
Total ARS: 682,240 Technicians: 218,989 All others: 463,251

This works out to the following changes:

Total ARS: +3,701 Technicians: +13,132 All others: -9,431

However, all is not as simple as it appears. As part of the restructuring changes, Technician Plus licenses will be renewed as Technicians. So the above apparent gain of 13,132 is inflated by such renewals, as is the apparent loss of 9,431 in the other classes.

Let's see how big this error really is. Looking at the renewal data on the Speroni site, we see that the number of Tech and Tech Plus renewals over the nine month period was 4,870. Because the FCC will not process renewals until the license is close to expiring, almost all of these 4,870 are Tech Pluses being renewed as Technicians. A fair estimate would be that about 4,700 of them were such renewals.

So the above numbers must be adjusted, because "Technicians" includes both code-tested and non-code-tested licensees. Doing the math, we get:

December 2000
Total ARS: 682,240 "noncodetested": 214,289 "codetested": 467,951

This works out to the following changes:

Total ARS: +3,701 "noncodetested": +8,432 "codetested": -4,731

Quite a difference from the earlier numbers, but it's still clear that the noncodetested numbers are growing while the codetested are shrinking. In round numbeers, the "noncodetested" are gaining at the rate of 937 per month and the "codetested" are shrinking at the rate of 525 per month.

But even THAT's not a complete or correct analysis.

All of the "codetested" licenses are, and have been, experiencing losses due to expirations - but none of the "noncodetested" licenses have expired. This situation will change in a week or so, however.

Suppose that the annual rate of expirations of "noncodetested" licenses is just 5%. Based on 215,000 licensees, that works out to 10,075 expirations per year, or about 840 per month. So the gain of 937 per month shrinks to just 97 per month IF a 5% annual dropout rate is correct.

In other words, the trend is not nearly so dramatic as was originally presented.

More important, however, is the simple fact that it is far too early to even guess at the long-term impact of the restructuring. It is also interesting that the January 2001 figures were not included. And it is to be expected that the easiest-to-get license will have large numbers of licensees.

"QSL" as a synonym for "yes," or "message received" is very old,
perhaps almost as old as amateur radio itself.

But "contact," meaning "I want to contact you" is quite new, less
than a decade of commonplace use I think. I think it migrated to
amateur radio from the Citizen's Band, though I don't know if it
originated there, and I welcome corrections if I'm wrong. All I know
for certain is that it was almost never heard on the HF amateur
bands from 1968 (when I started listening) until the 1990s.

Personally, I feel that "contact" when used with that meaning is
outside the amateur tradition and also outside good English usage,
so I don't utilize it. The traditional amateur term is "break."

With all good wishes,

Kevin, WB4AIO.

I don't see that the changes in either direction have been anything like "fast." If we factor out the Tech/Tech+ licencees, the number of General, Advanced, Extra and Novices have actually increased slightly since 1997. I don't see any significance to the percentages of increase or decrease of either the code-tested or non-code-tested hams. To date, the changes have been relatively minor.

What will tell, IMHO, is the attrition rate of the no-code Techs that come up for renewal soon. My speculation is that about 60% of them will not renew.

Lobster anyone? :-)

I don't think the number of hams who advance the state of the art has ever been very high. But the number of hams today who have a fundamental grasp of modern communications technology is smaller than it was in years past, IMHO.

The technical requirements for the old Advanced Class as well as the
old Extra Class have been folded into the new Extra Class exam, thus
reducing the number of tiotal questions and thus subjects that may be
covered. There are no additional questions that are even at the level
of the old Technician Class with regard to RF radiation hazard
evaluation. No tables that refer to same are given to exam applicants.

Hans, are you a VE? have you had access to the present exams as well
as former exams?
>

I dunno what your Morse speed is, but me thinks that whatever clocks
your brain waves is probably kinda of slow.

Respectful 73,
Hams need MORE license classes.

We do not choose to be guardians of the gate,
but there is no one else.
--Lyndon Baines Johnson (1964)--

Hams are totally responsible for the future of
Ham Radio. Not the ARRL; Not the FCC; But
Hams themselves. Unfortionatly the average
Ham is an old timer, unwilling to accept the
challenges of modern technologies, the cultural
changes of our nation, or the educational needs
of our people...He or she is only able to debate
the relative obsolence of Morse code.
--w2ilp--

>BUT--- if, like Cecil, you're telling me that Riley and his buddy Dale
>Hatfield insist that I and any serious percentage of ham radio licensees
>must become digital designers just to assure the survival of the ARS,
>you might as well go ahead and pass the word to them that they can begin
>the Big Shutdown anytime now.

I don't recall iether of them saying any such thing. Can you supply a quote?
They are both telling Amateur Radio, each in their own way, that Amateur Radio
needs to modernize. Why do you think they are saying that? My interpretation
is not that all hams need to become design engineers, but that hams should be
making use of modern radio communications techniques within the Service.

I also believe that individual hams should have the same relative grasp of the
communications techniques of today as our counterparts had in the 20s, 30s,
40s, 50s and 60s. In 1964, when I was a General, I was not the brightest ham
in the Service, but if I had taken the covers off of a commercial transmitter
of the day, I would have understood, at a block level, what I was seeing. How
many hams can say that today? When Amateur Radio first came into official
existence, it was virtually synonymous with the commercial radio of the day.
Do you think it would have been permitted back after WW2 if it was not still
relevant to the technology of the 1940s? can see many ways that the relevance
of Amateur Radio to technology has been important to us over the years. I
believe that such relevance is more important to us today than ever, with

Amateur Radio facing spectrum pressures that are greater than ever before.

> I for one am damn tired of being told what we "must" do to insure ham
>radio's survival, all the while the written tests are made dead-easy to
>pass without any effective learning of the material being absorbed by
>the entrant. And that's not just my opinion, rather dead on fact as
>evidenced by so many so clueless who aren't even bashful about admitting
>it publicly.

I have seen one admit it publically on this forum, Dick. I agree that changes need to be made to the tests, but I disagree that they are as useless as you imply. They are certainly, IMHO, just as valuable as that 16-page General study guide I studied in 1964.

> The whole situation looks more and more like a scheme to ease us out of
>our most commercially valuable spectrum segments, and that is something
>that I consider to be inevitable anyway.
You may be right; I am sometimes amazed that Amateur Radio has fared so well over the past years. But I don't believe that the FCC is scheming to take our spectrum away; they would not need to do so -- they have that authority any time they believe that Amateur Radio is not making as good a use of spectrum as others might.

>They WILL be taken from us as commercial demand for them
> reaches critical mass, as has always been
>done, and logically so.

All amateur spectrum is shared, with our sharing partners ranging from the military to radiolocation to unlicensed users. The trick is in finding compatibile sharing partners.

> But with hams having become so dumbed down
>they'll have the perfect rejoinder to our protestations- "We told you
>if you'all didn't become rocket scientists you'd lose frequencies...."

Again, I would love to see that rocket scientist quote by the FCC. Can you provide it?

More seriously, I simply cannot understand how you can lament the "dumbing down" of amateur radio (what with people having to study a 1200 question pool instead of a 16-page study guide) and then turn around and say:

> I for one am damn tired of being told what we "must" do to insure ham
>radio's survival, ...

If you really do believe that the written exams are deficient, and I do, just not to the near-total extent that you do, I cannot imagine why you are not suggesting that it is important that hams continue to learn those things that would raise us to the standards that the FCC would like to see. What I see instead is a lot of very negative "can't do" talk that is having just the opposite effect.

Care to join me in trying to make things a little better?

Seems that they are doing just that, Dick. Where is the pause in the development of computer technology? Where is the pause in the development of non-amateur wireless technology? I don't see any.

What value would be found in having the Amateur Radio service pause while the rest of the world marches steadily onward? What harm could come of stopping in our tracks?

Is this another thing that "might" happen?

You can rest assured that it cannot happen until the FCC makes a rules change that permits it. Even then, I think it unlikely that many hams, if any, will get on CW manually unless they know Morse code. No-code Technicians have had the right to use Morse code on VHF since day 1 -- how many have you heard on 2 meters mucking around in the CW segments?

But I thought CW gets through when no other mode will. Is that true only if
the other mode is not allowed to be used?

>There were wall-to-wall CW QSOs in the 40m Novice band in 1953.

Now, to be fair, Cecil, those wall-to-wall signals were heard on receivers with more than 500 Hz bandwidth.

BUt I agree that CW useage in the Novice/Tech+ segments has declined drastically over the years.

NOW YOU ARE SEEING THINGS MY WAY.

What do I propose to get out of this ancient worshiping rut?
I propose to technically make ham radio compatible with modern computer
science and practice...and for that to happen....

HAMS NEED MORE LICENSE CLASSES.

license
> classes. Ham radio isn't for everybody.

True ham radio can not be for everyone...BUT we don't want it to evolve
to be for no one.
By definition of Ham Radio, we can only refer to its OFFICIAL basis and
purpose, and thus to the exams which technically advanced hams of the
future may be required to pass.
Therefore I can't agree with your last statement, which denys the need
for more license classes. If you think logically about this matter,
you will find, as I have, that you are disagreeing with your own
previous observations.

Thank you for your comments and for reading my post anyway...BUT please
keep thinking.

No-coders have been authorized to work CW without any testing for code whatver
for about a decade now. What harm have they caused CW operators?

That's what I thought. Oh, there could be one or two who want to try out their
CW skills before they are really ready, but I suspect that someone will
"defend" the mode by making them stop.

I wasn't around then; my license expired in 1969 and I wasn't relicensed until about 1973 or so. I do recall reading (here, maybe) that a number of hams did quit the League over the whole deal. I am certain that they didn't all quit ham radio.

I think even then, postal regulations required a regular statement of circulation in QST. Your back issues should give at least a relative indication.

From: SLee@houston.net
Message-ID: <95vdcu$v1s$0@pita.alt.net>
Source record: 3075
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,alt.flame

I was surfing the web the other day when I ran across the lyrics of a song by Paul McCartney and Raoul Xemblinosky which was entitled "Roger Wiseman's Greyhound Men's Room Band." You can find the lyrics (which I think should not be published in a delicate family forum such as this one) at http://extra.newsguy.com/~shpxurnq/songs.html#song5.

Is this indeed *our* Roger. And how was it that he came to achieve such fame? That same web site claims that Roger was spanked off of Usenet entirely back in '97, but maybe it was someone else, because we all know that Roger is very much here, even though he's not all there.

Anyone care to enlighten us?

HF is not useless at all. As I tune outside the ham bands, I hear plenty of signals.

I think the real risk may be found in some of the broadband "wireless" networking that will be networking computers using residential phone wiring and electrical wiring, or providing broadband access over phone lines and even power lines. If Amateur Radio ever lost its primary status over these Part 15 users, it is over.

The "prisoner tap code" could be OO keyed. It can probably be done at about 5 wpm with a lookup table by someone not experienced in Morse code decoding. That seems more basic to me. If you agree that it is more basic than OOK Morse code, will you now support IT as the mode that all hams should learn to be considered fully versed in radio technology?

As an unspecified digital mode using a permitted modulation method and a publicized encoding, it is probably legal.

Excellent choice. Maybe there's a newsgroup you can go pester about
that.

>
> --
Sir,,

You are wrong on the above. Besides breaking the law and interfering with legitimate communications of other domestic radio services, the "skills" of "freebanders" hardly qualifies them for the promotion of the welfare of the community--among other things. If that were true, how come when there's a disaster (flood, tornado, hurricane, etc) they don't call on the "freebanders" to help out instead of ARES, RACES, the host of hams who are not in the above organizations, and Civil Air Patrol? How come they don't ask for "freebanders" to pass traffic on 27.555 instead of hams on 3872 KHZ, or 14.300? In time of disaster, when other comms are down, more traffic is passed by HAMS than any other group.

All this bullcrap about ham radio being "dead" is wishful thinking, bud. And for every "bad" ham that "may" be heard, I can find TEN CBers just as bad or worse. BUT! Does that make CB itself "bad"? NO! For every ten of the "bad" CBers, I can find 20 good ones. For every "one" of the so-called "bad" hams, I can find 100 good operators. The FCC's return to enforcement is welcomed by the rest of the Amateurs and, we hope, that their activity will weed out the bad ops. The rest of us that get smeared by the activities of a few welcome the departure of the jerks. Same with CB: you can't judge the entire service by the antics of a few morons.

Jerry

No, just giving code-tested versus non-code-tested license
class totals in the US ARS at the end of December of the
years 2000, 1999, and 1998.

I'll ask again, are you saying that already-code-tested license
class amateurs are switching over to the Technician class? :-)

FCC databases are updated daily, weekly, and monthly. How
the various tabulators want to do it is their option. The AH0A
site tabulates at the end of the month.

What I did recently was take the AH0A site tabulations at the
end of December for the years 2000, 1999, and 1998. From
that and from previous years' data given over two years ago, the
trend is quite clear...newcomers are more attracted to no code
tests in US amateur radio.

Even more telling is that the code-tested license class totals
are decreasing while the non-code-tested licensees are
increasing.

What are you saying? That code-tested licensees are opting
to change over to Technician class from a code-tested previous
class not a Technician-Plus? :-)

That is an ESTIMATE. By using personal estimates based only
on "gut feeling" or something, you are yourself in ERROR.

<snip>

>But even THAT's not a complete or correct analysis.

True, using your estimates is not a correct analysis. :-)

<snip>

>Suppose that the annual rate of expirations of "noncodetested" licenses
>is just 5%. Based on 215,000 licensees, that works out to 10,075
>expirations per year, or about 840 per month. So the gain of 937 per

>month shrinks to just 97 per month IF a 5% annual dropout rate is
>correct.

As far as ESTIMATES, you've failed once more. Note the
tabulation of NEW licensees which increased at 1184 per
month for the 27 months between beginning of January 1998
and end of March 2000 for Technician. The renewals for
those will be in the year 2008 to 2010...but the trend is for
NEW Tech licensees still growing after January 2001.

You've made a wish-fulfillment estimate on the "840 per month
Technician class expirations of 5 percent." That assumes that
percentage will expire and you have NO idea if they will do that.
New Technician class licensees are continually being added
and not just from "Tech-Plus renewals."

>In other words, the trend is not nearly so dramatic as was originally
>presented.

Your statement is "true" only in using incomplete and faulty
estimates. The trend is there whether you want to see it or
not. Your take on "drama" is unknown.

>More important, however, is the simple fact that it is far too early to
>even guess at the long-term impact of the restructuring.

Denial will never see any trend of any kind.

> It is also
>interesting that the January 2001 figures were not included.

Why? Is 9 months after restructuring somehow "faulty" but
10 months after restructuring is somehow "more correct?!?"

What about the two years PRIOR to restructuring? Go do
the figures again and see the trends. Here, I'll do it for you.

First three months of 2000: 163/month code-tested NEW
licensees; 1980/month NEW Technicians. Not affected
by April 15, 2000 restructuring.

All of year 1999: 196/month code-tested NEW licensees;
1165/month non-code-tested NEW Technicians. Not
affected by April 15, 2000 restructuring.

All of year 1998: 265/month code-tested NEW licensees;
1231/month non-code-tested NEW Technicians. Not
affected by April 15, 2000 restructuring.

> And it is
>to be expected that the easiest-to-get license will have large numbers
>of licensees.

The "easiest-to-get license" is a Restricted Radiotelephone
License or Permit from the FCC. No test, lifetime. I have no

idea of the number of those licenses or permits. :-)

Digitize-scan those commission papters, block out your private data if you wish, and post them somewhere. Or provide some indisputable proof of this "commission" through a third-party reference. Until then everyone has to assume you are not telling the truth.

>> > And by the way, I AM doing both.

Both? The driving distance from Dunlap, TN, (FCC database
address information) to Duluth, GA, is 3 hours, 17 minutes
by legal speeds. Assuming a one-way driving time of 3 hours,
work time of 8 hours with one hour lunch, the total commute
and work takes 15 hours. That leaves 9 hours to sleep, eat at
least one meal, do personal hygiene...and supposedly work
at a second job.

One of those jobs must not be 8 hours long or both of them are
part-time. [drive 6 hours for a part-time job?!?!?]

Something missing in the above considering there are only
24 hours in a terrestrial day.

>> "Both what?" Spending company time chatting about personal

Okay, just wondering. The reason is because we had an incident here a few years ago where the person was described in the local newspaper as a ham when in fact he was a just a guy using a marine radio (hey, it wasn't a CB, so that left only ham radio in the mind of the reporter).

> This guy has been at it for over a

Well, I don't know about the technically smart part, but he was an idiot for broadcasting false calls on the police frequencies. The police have enough to keep them busy, and I would sure hate to realise that a family member was put at risk because the cops were busy elsewhere with a false call.

Tracy, you keep blurting about the ARRL is "trampling" the ARS. Yet
they still print the Amateur's Code in every Handbook, which most of you
OF's appear to have completely abandoned. You're sending mixed
messages.
```

Now explain yourself rather than just making accusations. Thanks.

>> Shall we all have fun with word games here? Or would you
>> rather discuss some issues regarding the code-tested state
>> of US amateur radio license classes?
>
>It would go a long way if you would just TRY to make less inflamatory
>statements, Len. You seem to feel the need to taunt, or exaggerate, or
>belittle, or insult, in every stinkin' one of your posts. That's all
>this was about. Geez.

The "taunt" seems to be 31,971 NEW no-code-test Technicians
who came into the US ARS in the 27 months from the
beginning of January 1998 and end of March 2000...while only
6009 NEW code-tested US ARS licensees came in during the
same time.

Is it an "exaggeration" that the no-code-test Technician class
has been constantly growing since the beginning while every
other US ARS class (code tested) has not grown nearly as fast?

Is it "belittling" that over 200 thousand no-code-test Techs are
now in the US ARS?

Is it "insulting" that such facts are pointed out to those who
have been code-tested?

I suppose you are right. All this talk about stopping code
testing is sure "stinking," isn't it?

I suppose I should "apologize" for pointing out the obvious, but
what are over 200 thousand Technician licensees expected to
do when they are discounted, demeaned, taunted, belittled by
some souls who feel they are "superior" to "stinking" inferiors?

T. L.:

Wrong again. I could care less if they can beep at all -- as long as they're not whining about learning how to beep in order to attain higher HF privileges. However, its a moot point now. Pretty soon we'll have the beepless ARS you've always dreamed about.

Heck, for all we know it could be coming from the contact managers everyone has on their computers today. Or it could be coming from the business world. I've noticed a lot of business people saying that today - the word "contact" both as a question and statement (meaning "will you contact..." as a question or "yes, I'll contact..." when answered back). In other words, who knows where this stuff comes from.

Yep. That has been my objection with Code Quick. To me, it would be fine
for learning code - up to about 8-10 wpm. I doubt if the extra level of
translation would work well at higher speeds.

I agree with your opinions, for the most part, but this is not
generally true: Heat as electron agitation only would hold
under certain circumstances, for example in a plasma of some kind.

Electrons almost always are in atoms, and thus they take on
discrete, quantized levels of energy which
are definite and not random.

Heat is usually defined as the degree of randomness of motion
of atoms.

An electric current can cause electrons to move in a medium by
jumping from atom to atom; this causes essentially random
motion in the atoms (say, in a resistor), and thus a rise in
temperature. Removing the electric field leaves the atoms
moving more randomly, but the electrons are not at all random
in the reference frame of the atom with which each one is
associated. If the atoms were not moving randomly, the
electrons would not be, either.

In a conductor, the electrons (in the conduction
band) hardly interact at all with any individual atom;
therefore, with an applied potential, they transfer
little random momentum to the atoms; therefore, they don't
heat it very much.

There was a lot of that going on, and FCC with nudging from ARRL introduced incentive licensing in a serious effort to change that. And it clearly worked, until 1985. Now they've turned 180 degrees, and you're right in the same basket with them.

I don't know why that should be surprising. The technololgy of today is
far more complex than earlier days. To properly do DSP one needs to also
be familiar computer programming techniques. It must be a function of
the fact that you spend most of your time around hams who are also
highly technically trained, but you don't seem to be aware of how small
a percentage of hams are.

It came from CB sidebanders back in the mid-70s or so. They wanted to
talk like hams, but they didn't want to say "break" because it sounded
too much like AM CBers, so they started that idiotic "contact" crap when
they wanted to break in.

When I want to break in, I just give my call letters. It gets the job
done, and saves time letting people know who's breaking in.

There are lots of reasons why. One is the huge antennas ("huge", by the
standards of those used to VHF/UHF and 10 meters) Another is the nightime
nature of the band.
>
>>go to 40 meters,

Most of us are at work then. When we get home, there are a zillion things to do
before thinking about radio. Gone are the days when Mom took care of the kids
and the meals and the house and Dad could go on the air right after dinner.
Getting on the air requires a block of time when you have some uninterrupted
time and no pressing responsibilities. That's a rare commodity for most of us
with houses and kids and two careers.
>

The last few nights 40 has been hopping. Just worked YL2SM - 589 both ways.
Sometimes it's hard to find a spot to call CQ between the low end and 7050 -
and that's with a receiver that has cascaded 8 pole 500 Hz filters.

It's the time of day and the MUF. Plus lifestyles.

I was around back then (Novice in 1967, Advanced in 1968, Extra in 1970). The moaning and whining by some who "lost privileges" was amazing.

But what was more amazing was how few folks knew the real story of how it all came about. The FCC wanted it, but the ARRL got the blame for it because the BOD didn't oppose it. Truth was, the FCC said it was gonna happen one way or another, so the BOD got them to tame the proposal somewhat.

For example, the FCC proposed demoting existing Advanceds to General, then creating a new "Amateur First Class" with a new written and 16 wpm code test (that would have made FOUR code tests!). Plus even more subbands and other gobbledygook. The ARRL talked them into dropping that one and letting the 40,000 or so existing Advanceds have more privileges.

Another deal was that the Extra CW band was going to become the lower 50 khz of 80/40/20/15, not just the lower 25. But the FCC quietly canceled that part in mid 1969, and it never went into effect.

And the whole thing was about hams not having enough technical knowledge, and turning into appliance operators. The code test thingie was the FCC's idea. In fact, the original 1963 ARRL BOD idea was simple: Bring back the pre-1953 system where you needed an Advanced to run phone on the ham bands between 2 and 28 MHz. (In other words, all HF phone except 160 and 10 meters).

Oddly enough, the numbers worked out exactly the opposite of what W2NSD and his ilk supposed.

From 1946 to 1963, the number of US hams more than quadrupled, from 60,000 to about a quarter million. The growth was steady until 1962, then all of a sudden it stopped dead. There were lots of reasons, which I won't go into here, but incentive licensing wasn't one of them. Incentive licensing was more than 5 years in the future at the beginning of 1963.

From 1963 until about 1970, the number of US hams held steady at around 250,000. Then, after incentive licensing was in effect, it started growing again. By 1979, 350,000 had been reached. Half a million US hams was reached just 5 years later. Over 600,000 by 1990 - BEFORE the Tech lost its code test. Go figure.

The hams of the time were split about evenly between supporting and opposing incentive licensing. A few left the ARRL and a few gave up ham radio completely - but only a few, and they were quickly replaced by newcomers. The ARRL BOD still feels the wrath of those times today, even though many of the present directors weren't even hams then. I don't think any of them were ARRL officials then, either.

--

Assuming an annual dropout rate of just 3%, only about 36% of those 1968 hams are still hams today - that's about 90,000. Works out to 13% of the 682,000 US hams licensed now.

I'm one of 'em. Sure doesn't seem like 34 years.

I must be doing something wrong, then. I work lotsa FISTS members, but the QSOs all turn into nice ragchews. Maybe we trade numbers, maybe we don't - they're all on the website anyway.

7058 is full of foreign 'phones nowadays, anyhow.

40 has been hopping recently - worked a Hungarian last night, and when I signed with him a KT4 that I last worked on Xmas Day called me to catch up. Nice chat - then when he and I signed, a UA3 called me. Pretty decent for a homebrew 100 watt CW transceiver and an inverted V at 35 feet, huh?

Now I'm gonna see what's going on tonight before bedtime.

This isn't rocket science either, Ed. Where's the logic in expecting
any substantial percentage of non-technical people, which is what the
majority of hams are, to stay current on the intricacies of the latest
digital communications techniques? Does it seem in any way likely to
happen, when the vast majorithy of the newly licensed come from a
one-day study-the-test session where all fee payers come away with a
license? You really think any serious percentage of hams would have a
clue about "block diagrams" when looking under the hood of an IC756?
Most of the components these days are SMt and impossible to even
identify visually even if you know what you're looking at, unless and
until one has been to the "factory service school" on the particular
piece of gear, and that as a professional technician!
Even old fellers like me, who spent the working career AND 44 year ham
radio experience mostly in the technical side of radio find it beyond
reasonable that it be demanded of us that we abandon what we know and
like in favor of some dippy digital engineer's ideal of what radio
communications should be today, just because he has found that he is
capable of scrambling the numbers and inventing some new mode each week.
In a word, much of it is BORING.
As I noted earlier, history is littered with "better idea"s that didn't
make the cut. The good stuff, the things that attract people, has a way
of staying around long past the tenure of many successive
"improvements". Commercial communications has its objectives. They have
diverged rather seriously from that of ham radio in the past decade or
two. There is no valid reason why hams should be mandated to follow the
same path when there is simply no need.
If the ham bands were clogged and overcrowded such that spectral
efficiency (especially at HF) was an issue there would at least be some

reason for it. That is simply NOT the case and as noted earlier. Especially at HF. Activity most of the time is reduced, no doubt by massive amounts of time previously devoted to on the air ham activities now spent on the Internet, as we are doing now. It's a case of "technology for its own sake". Not good enough. Many hams will simply abandon ship first. If I must give up what I find attractive in ham radio for all-digital radio communications, I'll just go internet full time. I know hams who have done exactly that.
In fact, this ongoing argument has reduced my interest in digital modes. I was an early packeteer, following even earlier RTTY activity, from an old MOdel 15 that stripped a fiber gear and was replaced a Commodore Vic 20 with a Microlog Air One module when that was the latest, long before IBM PCs came on the scene. All this constant haranguing about how we "MUST" has about got my disgust level up and my digital radio interest down.

The prisoner tap code was never a radiocommunications mode, and was not
designed to be. Military men who needed to communicate over radio knew
enough to use Morse.

I don't think that either of those reasons would explain the reduced activity on 80 as compared to 10 years ago. My guess: One reason is the Internet. I have considerably reduced my on the air time because I play on this computer. I doubt that I am alone in this. Another possible reason might be that most of the 80 year olds I worked 10 years ago are no longer with us, and there are few 20 year olds to take their place.

>Most of us are at work then [9am - 3pm]...

And lots of us don't work then. Even before retirement I did lots of shift work so I was often on 40 during those afternoon hours. But for comparing now to then, likely as many hams worked then as now during those hours...

>Antennas may be part of the problem [why 30 is dead].

Sometime I wondered about that. But when I did find a QSO the signals were good each way, and we had the band completely to ourselves...

Not till nearly ten years later. He did his thing in the late 70's, and
it led directly to the adoption of the question pools and VE testing
system.

: around....HAHAHAHAHAHA!!!

What an amazing coincidence it is then! The several songs about "Roger
Wiseman" on http://extra.newsguy.com/~shpxurnq/songs.html mention
Marshall County, West Virginia (see "Hit the Road, Bucktoothed Choad").

Imagine that: Two Roger Wisemans in Marshall County, both of whom use
the same colorful language. Apparently, one of them was booted off
both alt.fan.karl-malden.nose and alt.flame some years ago.

Fancied himself to be a flamer, but got laughed at.

It seems that Raoul Xemblinosky wrote his songs in the same language Roger used
to commemorate that auspicious occasion.

But, hey: You deny that songs like "Imagine #2" were written about you,
and who are we to question that?

Morse code was originally designed to be a wire communications mode, deciphered
by machine. It was adapted to radio use.

Yup. The FCC did not understand what was really going on at the time at all.
They still don't. I also think that the FCC was reacting to "Sputnik fever"
(the whole incentive licensing thing started very quietly in 1958, right after
the launch of Sputnik)
>
>>The growth was steady until 1962, then all of a sudden
>>it stopped dead. There were lots of reasons, which I won't go into here,
>
>What were the reasons?

Well, you asked, so here goes. Please keep in mind that there was no single
dominant reason - there were a lot of little ones that all added up to the
growth suddenly stopping.

- SSB: A few hams had been using SSB since 1933. Lots more started using it
after 1948, when the phasing and low-cost filter methods were developed by
folks like Mike Villard, W6QYT. By 1962, the introduction of easy-to-use gear
primarily designed for SSB (S-line, KWM-2, TR-3, etc.) turned the tide and made
SSB the most common voice mode on the HF ham bands. But this meant that SWLs
could no longer easily listen in on ham QSOs, as they did in the AM days. Short
wave listening was a major soiurce of new hams back then that was seriously
reduced by the predominance of SSB. The cost and complexity of an SSB setup
also had a negative effect on prospective hams by making it more expensive to
get started on 'phone.

- FCC rules changes: In those days you had to live a certain distance from a
quarterly FCC exam point in order to have the option of taking the Conditional
test by mail instead of doing the General in front of an FCC examiner. In 1963

the distance requirement was increased from 75 miles to 175 miles, and the number of FCC exam points increased as well. Huge areas of the country that used to be "Conditional country" suddenly became General territory. This change meant that the investment of time and money to upgrade greatly increased because you couldn't go to old Joe across town for an exam at a convenient time - you had to make a trip of up to 175 miles "air line" to an FCC exam point that might only have exam sessions four times a year. Since a Novice back then was only good for a year and could not be renewed or retaken, this change greatly increased the dropout rate. To add insult to injury, the FCC started charging fees of $4 to take the exam (pass or fail). $4 was a bit of money back then to many people - about $20-25 in today's money.

- CB: 27 MHz CB had been introduced a few years earlier, but by 1963 the number of CBers was greater than the number of hams, and growing fast. The equipment was inexpensive, the antennas small and simple, and there was no test at all. Although licenses were required and there were strict regulations about the new service, many CBers simply ignored the rules and did as they pleased. Soon it was discovered that the FCC could not enforce the rules with any great degree of effectiveness. Many people who might have become hams went to CB instead.

- Cultural changes: Ham radio has always been a sort of "square" thing, to use a term of the day. Very few hams of '60s looked like John Lennon or even Austin Powers. Famous amateurs of the time were folks like Barry Goldwater, Curtis LeMay, Arthur Godfrey - hardly "flower children"! The emergence of the '60s "counterculture" drew lots of young people away from things like ham radio. Vietnam didn't help, either.

- TV and other media: TV watching increased all through the '50s and '60s. More stations were on the air more hours in more places, resulting in less time for ham radio. I remember seeing test patterns on TV as a young child, and there being only 3 TV stations in a major market like Philadelphia. I also recall many people in outlying areas like the New Jersey shore foregoing TV because it required a huge antenna to get a snowy picture. That all changed over time, mostly in the '60s. The internet and PCs have had a similar effect in the past 5-10 years.

- Economic conditions: For some reason, ham radio tends to grow more during periods of bad economic conditions than during good ones, with the single exception of the 1950s. The roaring 20s showed slow growth, while the Depression era produced a near-tripling of the number of US hams in less than 5 years. WW2 shut down ham radio for much of the '40s. The affluence of the '60s produced no growth while the stagflation and oil crises of the '70s and early '80s more than doubled the number of hams. When did the growth of the early '80s stop? About the time the stock market really took off. (When Clinton took office in 1992, the Dow was 3620)

And that's just the short list!
>
>>Then, after incentive licensing was in effect, it started growing again.
>
>Did Bash have anything to do with it... :-)

Probably a small effect. Many of the above causes reached "saturation" by 1970. For example, the FCC eventually dropped the fees and began giving license tests at hamfests and club meetings using traveling examiners. SSB became so entrenched that decent used first-generation gear became cheap. SWLs were replaced by scanner enthusiasts, who encountered ham radio by way of FM repeaters. CB lost its newness and got overcrowded. TV became commonplace and the quality of the shows sagged. The draft and Vietnam ended. Economic conditions got bad.

Waddya think?

It is not more difficult to understand the fundamentals of how it works than it is to understand the fundamentals of AM, FM, SSB.

> To properly do DSP one needs to also be familiar computer programming
> techniques.

In 1963, I could not "do" an analog filter. One does not need to be a programmer to understand how DSP functions.

> It must be a function of the fact that you spend most of your time around

I am quite aware of the present technical status of hams, Dick; I spend about 2 or 3 hours a day on the phone, answering their questions. Most of them don't share your "can't do" viewpoint.

I agree that it is not intelligence; today's hams are probably, on the whole, a bit smarter than we were.

I don't agree that the technology is so advanced that today's intelligent hams cannot learn the fundamentals of how it works. I believe that it is a chicken-and-egg sort of thing, with such techniques not in use in Amateur Radio, so hams don't learn about them, making it less likely that they will be in use in Amateur Radio. The net effect, unfortunately, is that the rest of the radio world is passing us by.

Yeh, you keep saying that. So let us review.

Len brings up the fact that the numbers of coded hams are decreasing and the numbers of non-coded hams are increasing (the "point" of the discussion). He uses a balance scale term. You cannot comment on the facts of the ham population, so instead dissect balance scale engineering, and thus you claim Len's statements false. Ergo coded ham populations are increasing. Nice fantasy.

Am I still in over my head?

I can indeed figure it out. If that PSK-31 signal was more than about 30 Hz
away from "zero beat," it went on just fine and the CW ops experienced QRM. Of
those two commonly available modes, which one got through while the other did
not?

CW has a necessary bandwidth of about 50 Hz. Go ahead, start calling CQ 51 Hz
away from a CW QSO in progress and tell me the result.

>In a word, much of it is BORING.

> As I noted earlier, history is littered with "better idea"s that didn't
>make the cut.

Modern radio techniques have very much made the cut, Dick; they are being used everywhere outside of Amateur Radio (and even a little bit within it).

Why do you resist learning new things?

> Commercial communications has its objectives. They have
>diverged rather seriously from that of ham radio in the past decade or
>two.

Yes, they have progressed while we have paused, to use your word from a previous post.

> There is no valid reason why hams should be mandated to follow the
>same path when there is simply no need.

If Amateur Radio were not in touch with the technology of the 40s, we would not be here after being shut down after WW2.

>If the ham bands were clogged and overcrowded such that spectral
>efficiency (especially at HF) was an issue there would at least be some
>reason for it.

It is not necessarily an issue of overcrowding, Dick; it is an issue of amateur radio being seen outside of our circles as being more than an anachronism. Ane the overcrowding issue can be part of it, too. In most urban areas, a ham who wants to put up a new repeater is told that "no pairs are available." Yet, tune the band, and most of the repeaters sit idle most of the time. This is not an efficient use of spectrum.

> If I must give up what I find attractive in ham
>radio for all-digital radio communications, I'll just go internet full
>time.

You must have me mixed up with someone else, Dick; I have never proposed ahtat you have to give up doing what you enjoy in ham radio. I am proposing that more hams learn the most fundamental components of modern radio technology. Unlike your view of your favorite mode, I am not proposing that you have to take a pass/fail test in these fundamentals to be licensed, although a few more questions about them would be nice.

I believe in the ability of hams to learn and grow. If more information is made available in amateur circles, they will come and they will learn and when such techniques come to be used in Amateur Radio, they will have an understanding of their advantages and disadvantages. Some hams will continue to thirst for radio knowledge, others will "pause," but as long as the Service as a whole continues to grow, we will have met the technical components of our regulatory objectives.

> In fact, this ongoing argument has reduced my interest in digital
>modes. ... All this constant haranguing about how we "MUST" has about
> got my disgust level up and my digital radio interest down.

Let me be perfectly clear, Dick; I do not believe that you "must." You are quite free to rest on your laurels and let others carry on, if that is your wish.

But imagine how some of the talk about "must" affects other hams, whose budding interest is being shot down just like yours -- with all this talk about "must" with respect to Morse code. I believe that if some folks were not telling them how Morse code is a big hill to climb to prove their character, more of them would sooner or later want to give the mode a whirl.

> They wanted to talk like hams, but they didn't want to say "break"
> because it sounded too much like AM CBers, so they started that idiotic
> "contact" crap when they wanted to break in.

In some contexts, it is more useful to break into a net in such a way that the reason for the break is announced at the time of breaking. On the SSB county hunters net, "last county contact" is often used to break NCS between running mobiles so that an individual mobile or portable station can ask for a minute to move a contact for a last county in a state off the net. Break is generally used to indicate a mobile who needs to run his/her county off frequency rather than wait on a long list to be run on the main frequency. I could imagine "contact" being a way of breaking an existing repeater, indicating that the breaker wanted to make a call to establish contact with another station not involved in the ongoing conversation.

>When I want to break in, I just give my call letters. It gets the job
>done, and saves time letting people know who's breaking in.

Contact gets the job done, and saves time letting people know the purpose of the break. Either is legal under FCC rules.

Will the method of breaking into a repeater now join the importance of using "name," "handle" or "personal" in the annals of what is important to modern amateur radio?

Troll number two?

It doesn't matter which license class is inserted in the blank, Len.
You still can't make me believe that the balance scales are tipping
until any group of non-code tested hams exceeds the number of code
tested hams. No scales have begun tipping so your original claim is,
like several others you have made, false.

I have no doubt taht a bit of fiber in your diet would go a long
way towards changing your attitudes on life.

You can change that to "8515" if you have the intestinal fortitude
to engage in a personal conversation. Knowing you for the coward you
are, I'll just go on about my day.

Past events would indicate that you don't have that fortitude.
Not even to say "I am busy right now". However you then have great fun
creating fictional events SUBSEQUENT to that. You always do.

And by the way, we are a subsidiary of Antec, "Electronic System
Products". Bob's stock problems are his own, thankfully.

I don't think anyone will dispute that statement. That is not the statement you originally made, Windy--the one with scales tipping. It is obvious that with an easy test available, most folks will opt for that one initially.

So?

We could even come up with a new and radical assumption from all of this: maybe some code tested hams are turning in their tickets and obtaining non-code tested licenses. That could certainly account for the increase on one hand and the decrease on the other.

Do you have anything interesting for the group or can we expect more number crunching ala Len?

You, of course assume that non-code tested licensees will never upgrade.
What is this rate of change supposed to mean to us, Len? Why all this
"mountain eroding" and "scales tipping" guff? It would appear to be
something which is natural given the current licensing structure and it
certainly doesn't worry me. Why should it worry you, a non-licensee?
I don't think those scales will tip in your lifetime. Would you like
one of us to give you a report in the afterlife? Please provide a
forwarding address.

His statement, taken as a whole, was false because of his incorrect analogy. When Len can carry on a dialog without inserting all of the silly phrases such as the obviously wrong one which he used, maybe someone will take him seriously. Just maybe.

When viewed as an obvious troll meant to stir things up rather than to really discuss anything, Len's post has little meaning. Len isn't a ham so he isn't contributing to eroding mountains or tipping scales one way or the other. He knows a few hams though.

Your own role here is an interesting one. For several years I've had the opportunity to observe you playing defender for the likes of Len, Cecil and Carl Stevenson. If you'd like to continue with analogies, I'd describe your perception of amateur radio reality with a term from ionospheric propagation: skewed path.

Yep. And when the first radio experimenters began to develop the
fledgling RF communications system they very quickly realized that Morse
was a natural for use with a system where the most basic requirements
were simply to key a carrier on and off with information encoded in
those bits of RF....
It WAS a natural. Still is.

Sure is; I use it for almost all of my hamming, and it certainly is the most enjoyable. It is very useful to Amateur Radio. The difference in our opinions is that I believe that its usefulness is enough that hams will use it whether they are required to learn it to get their licenses. I also believe that hams will not get on the air and use it unless they know the code (unless they use a TNC or other computer encoding/decoding scheme).

The Extra Class license is still required to obtain all amateur priveleges. The number of steps required to get there have been reduced, with each step being more difficult than it was before. The Technician with HF endorsement is now the entry-level HF license -- how much harder is is than the Novice used to be? Is this your idea of a 180-degree phase shift?

I have said often that I believe that amateurs need to learn more about modern radio technology; you have disagreed with me. Just what basket are you saying I am in?

How do you feel about those that have learned how to send and receive Morse code, but believe that changes need to be made in the way Morse code is tested?

> However, its a moot point now. Pretty soon we'll have the beepless ARS
you've always dreamed about.

I do not believe that Morse code use will end any time soon, Larry. Do you feel that the mode has so little value to ham radio that no one will learn it and use it unless it is tested? I disagree; all of the other modes have avid proponents without such testing. I do not agree with you that those modes that use code are the bottom of the pile.

I don't know if I dare to make another lobster bet with you! :-) At least a 60% chance I will be at Ft Tuthill, though.

But I do deserve a chance to break even, so here's the deal: In the first 3 full months of the time period where no-code Tech license, I think that more than 60% of those Technician licencees eligibile to renew will not do so. If the percentage that renews is >40%, you will win. In very unlikely event it is precisely 60.000%, we each buy a lottery ticket and go dutch treat on the lobster. :-)

What say?

Why do you insist on dodging my point? Would it destroy your most
effective weapon, your assertion that I actually DO resist learning new
things?

What I said is that I have tried almost every new mode that came along
and for the most part they are BORING! And yes, I "learned" new things
about them, contrary to your assertion. Sure modern techniques have made
the cut.
I use them every time I turn on a rug. But I gotta tell ya, I prefer the
old crystal filter to anything DSP has offered to date. I'm on my fourth
DSP and so far I see nothing but disappointment from any of them. I also
have a little audio autonotch filter that has had much more use against
the carriers of the many RF spammer/jammers that all this infusion of
'new blood' has brought.

Really? Maybe you have paused, but I don't think that Icom and Kenwood
ant others would be cranking this stuff out by the shipload if hams
weren't buying, do you? If I still used the old homebrew 6ag7/807 rig
and BC454 receiver you might have a point. But the continued assertion
by all the folk who have such vested interest in "progress" for its own
sake is getting to be just as boring as the constant glowing raves over
DSP.

Dodging the issue? Why so all you "we all just gotta change everything"
mavens ignore the fact that we hams do this not because we want to just
communicate- we have cell phones for that- but for much deeper and more
complex reasons.

Evidently FCC and most of the others who seem to be monitoring our
every teansmission to see what old mode we insist on keeping can't see
the forest for all the trees.

Ane
> the overcrowding issue can be part of it, too.

I clearly remember the days when that was indeed a factor, when 75 meter
voice band was one big series of heterodynes. Sure, the move to SSB was
definitely justified to relieve that. There is today no such problem,
nor anything even remotely approaching the congestion of the 50's and
60's.

In most urban areas, a ham who
> wants to put up a new repeater is told that "no pairs are available." Yet,
> tune the band, and most of the repeaters sit idle most of the time. This is not
> an efficient use of spectrum.

It sure isn't, but that is not a technical problem, rather one of
administration that could very easily be resolved. The fact that all
paris are "assigned" is the problem. You just have to offend those who
need to be offended since they are too selfcentered to do the right

thing themselves. No one should have the inherent right to tie up a frequency pair just because he asked first. It should be a use it or lose it situation. Repeaters should only rarely be approved for individuals where they can preclude many other potential users from use of spectrum, the rule should be 'show your real data or be denied'. It's a failure if administration that the repeater fiasco is allowed to continue as it has.

> hams learn the most fundamental components of modern radio technology.

Unlike
> your view of your favorite mode,

You don't even understand that CW is NOT my favorite mode, although it is one of my favorites. From long experience I know how effective it can be. If operators equip themselves to use it. You don't seem to yet understand- or do you just prefer to ignore- that my outlook is that it is just as irresponsible of ham radio operators to refuse to learn to use CW, the basic radiocommunications mode as you believe it to be for them to ignore DSP techniquues. It is also irresponsible for ARRL and FCC to ignore the most basic radiocommunications mode. Do they all think that there will never again be any need for anything basic?

> I am not proposing that you have to take a
> pass/fail test in these fundamentals to be licensed,

Well that's appropriate since you don't have to learn enough to pass a test on them to be able to use them. With the only code test at 5wpm there is no valid rationale whatever for avoiding learning Morse code. Even if you don't intend to use it. Many hams -even most- learned it who never intended to again touch a key and along the way discovered that it was very different than expected, and many became advocates of the mode. I was one.

> although a few more
> questions about them would be nice.

Ah, yes, gotta fill up those question pools, whether or not anyone learns from their afternoon cram class before the test.

Check this posting .....I changed a few names and callsigns to keep the guilty from protesting.

The -xx- County Repeater Association and -xx- County ARES (Amateur Radio Emergency Service)are again pleased to announce a free Technician License Class.

Participants attending the free one-day class will be prepared to take
the 35 question test required to obtain the entry level Technician Class
license.
The class consists of video, Power Point, lecture and live
demonstrations of
SSB, CW and many digital modes. We have a success rate of about 70% of
our
students getting licenced. No book or other material is required for the
class except pencil and paper. There will NOT be a testing session after
the class.
Saturday March xx, 2001 8:30 to 5:00 -xx- County Government Annex At
the
Corner of ---------xx-------, xx xx214 Upstairs in Room xxx For
information on the class: e-mail xx5xxx@arrl.net Talk-in on 145.xxx -
1xx Hz PL

There it is... So you might as well send them a full course in the
latest digital modes, I'm sure they will absorb it just as
well.

>
> I believe in the ability of hams to learn and grow. If more information is

> understanding of their advantages and disadvantages. Some hams will continue
> to thirst for radio knowledge, others will "pause," but as long as the Service
> as a whole continues to grow, we will have met the technical components of our
> regulatory objectives.

Taking lessons from Cecil? Your use of "pause" to indicate refusal to
learn is way out of context and you know it or should. Knowledge, is not
the issue, rather the contined assertion that "we all gotta move on to
the latest digi gadgetry or we'll stagnate" BS is the issue. We HAVE
moved on, and not all of it has been beneficial other than to the bottom
lines of manufacturers and retailers. And maybe the ARRL.

I truly believe, indeed KNOW that this continued incessant demamding
has caused many hams to abandon ham radio, just quit. I know some who
have done it. They heard all of the nonsense they wanted to hear, and
moved on to pursuits where less trivial drivel is involved. If you want
hams new or old to learn new you need to show some actual benefit of
that learning. Basics of new techniques, to the extent that they can be
learned by non-technical persons are certainly appropriate. Strangely
they are absent from the question pools for the most part. And for sure
no one is about to learn anything serious by just associating an answser
to a question, nor by attending a one-day "guaranteed" tech license cram
cursse. But you're welcome to keep on talking about it, as you wish.

>
> > In fact, this ongoing argument has reduced my interest in digital

> quite free to rest on your laurels and let others carry on, if that is your
> wish.

You ARE taking your cues from Cecil. I rest on my laurals as a ham
simply in that there are no more ham radio tests for me to take, the
last one was over thirty years ago. If you believe that I haven't learnd
anything since that time I'll just lump you in with Cecil, and surely
you don't want to be there.

>
> But imagine how some of the talk about "must" affects other hams, whose budding
> interest is being shot down just like yours -- with all this talk about "must"
> with respect to Morse code.

If a few of you CW lovers whose real beliefs were not trumped by
Politically Correct demands foisted on you by a few geeks with an Agenda
would instead just simply state the facts--- that any ham who overlooks
learning Morse code is missing the very most basic radiocommunications
mode yet devised, and instead urge all hams to learn it as a matter of
course, none of this would be necessary. Instead you cower like so many
sheep.

> I believe that if some folks were not telling them
> how Morse code is a big hill to climb

You've got it backwards, again. It is not nearly as hard as they first
think it is, when they decide they just don't want to, and that has been
the point. Why do you contradict it?

>to prove their character, more of > them would sooner or later want to give >the mode a
whirl.

Based on knowledge of how things have worked in the past that is most
unlikely. No one excapt a few of us posting here has a single good word
to say about it. Extremely few newcomers are informed and with the
current attitude at HQ and by all the ridicule and criticism it and its
supporters get here there's not much chance of improvement. The Big Dumb
Down will just continue until the Big Shutdown.

No, Len, it is not correct. Let's look at what you wrote:

"In the 9 months following US amateur radio restructuring, the total
number of US amateur radio licenses increased by 3,701 (+0.55% of
total)."

That part is correct. Subtract the total number of licenses in December
2000 from the total in April 2000 and you get a difference of 3701.

"Code-tested licensees declined by 9,531 while non-code-tested
licensees increased by 13,132."

That part is NOT correct. First off, there's a minor arithmetic error
(9431 not 9531). But the big mistake is that you equate "non-code-
tested licensees" with "Technicians". The two are not the same. Some
holders of Technician licenses are code-tested, and have some HF
privileges.

You wrote "licensees" not "licenses", too. So you were referring to the
people, not their licenses.
>
> Since your arithmetic is the same as mine, my analysis
> using the stated conditions is very correct. :-)

Your arithmetic contains a small error. And your analysis is flawed and
in error, as I have shown.

> >would be that about 4,700 of them were such renewals.
>
> That is an ESTIMATE.

Yes, it is. It's also true - the FCC renewed 4,870 Technician and Technician Plus licenses in that time period, and reclassified the Tech Pluses as Technicians. The holders of the licenses - the licensees - are responsible for maintaining proof that they have been code tested if they want to retain their HF privileges.

This stuff is all explained on the Speroni site. Your failure to include it in your analysis is a serious error that reduces your credibility.

> By using personal estimates based only
> on "gut feeling" or something, you are yourself in ERROR.

My estimate is not based on "gut feeling". It is based on a thorough knowledge of the information, the applicable regulations and basic math as applied to statistics. It's a fair estimate.

Your analysis did not include the fact that the FCC is renewing Tech Plus licenses as Technicians, and that by doing so, one cannot equate "Technician license" with "non-code-tested licensee". By improperly putting code-tested Technicians in the non-code-tested category, you overstate their number and understate the number of code tested licensees.

The error is not a small one. 4,700 of 13,000+ is more than a third.

If there is any error in my analysis, it is that the number 4,700 is too small. Also left out are all Technicians who have passed the 5 wpm code test but not upgraded to General or Extra yet. They are "code-tested licensees".

End result is that your numbers are way off.
>

> <snip>
>
> >But even THAT's not a complete or correct analysis.

It is far more correct than your analysis.

>
> As far as ESTIMATES, you've failed once more.

How do you know? What is faulty in my estimate? I clearly
said "SUPPOSE" - that makes it hypothetical.

> Note the
> tabulation of NEW licensees which increased at 1184 per
> month for the 27 months between beginning of January 1998
> and end of March 2000 for Technician.

The actual numbers jump all over the place from month to month. And the
tabulation is of new licenses, not new licensees.

The number of new Technician licenses proves one thing: Most people
starting out in ham radio do so by getting a Technician license. The
data does not tell how many of those new licensees later upgrade,
because upgrades are lumped into "modifications".

> The renewals for
> those will be in the year 2008 to 2010...

Which has no bearing on the analysis. What really matters is how many
will come up for renewal, and be renewed, in the near future. My hope
is that the renewal rate will be very high. 99% would be great. 100%
would be even better, but is probably not realistic.

> but the trend is for
> NEW Tech licensees still growing after January 2001.

That's an ESTIMATE on your part. Nobody knows what the renewal rate
will be like until they actually start to expire.
>
> You've made a wish-fulfillment estimate on the "840 per month
> Technician class expirations of 5 percent."

That's simply not correct. I don't "wish" for a 5% dropout rate -
I "wish" it would be 0%. The 5% is just a highly-educated guess, and
identified as such.

By ignoring the fact that no Technician licenses have expired yet, your
analysis is even more faulty. My estimate is closer to the facts than
yours because it includes relevant corrections. My method is simply
more accurate.

> That assumes that
> percentage will expire and you have NO idea if they will do that.

It was identified as a "suppose". You ignored the whole expiration
thing completely. My analysis is more correct because the relevant
factors are included, and estimates identified as such.

You have no idea how many will expire and how many will renew, either.

> New Technician class licensees are continually being added
> and not just from "Tech-Plus renewals."

Of course! No one denies that, least of all me. But as I have shown, at
least a third of the ones you have credited as "new non-code-tested
licensees" are actually code-tested Tech Pluses renewed as Techs. The
real number is probably close to 40%. That's a BIG error, Len. And it's
an avoidable error.
>
> >In other words, the trend is not nearly so dramatic as was originally
> >presented.
>
> Your statement is "true" only in using incomplete and faulty
> estimates.

My estimates are accurate within the limits stated. My analysis is more
accurate than yours. Much more accurate.

> The trend is there whether you want to see it or
> not.

The trend is that most new hams start out with Technician licenses.
That's been the trend for over a decade. Some upgrade, some don't.
Describing all Technicians as "non-code-tested licensees" is simply not
correct or accurate.

> >More important, however, is the simple fact that it is far too early
to
> >even guess at the long-term impact of the restructuring.
>
> Denial will never see any trend of any kind.

I'm not denying any trends. I'm just stating the facts and pointing out
your errors. Which of my facts is not true?
>
> > It is also
> >interesting that the January 2001 figures were not included.

>
> Why? Is 9 months after restructuring somehow "faulty" but
> 10 months after restructuring is somehow "more correct?!?"

10 months of data are available, so why not include them? The longer the baseline, the more accurate the extrapolation or interpolation.

Basing conclusions on the 10 months of data following the restructuring is, by definition, more accurate and correct than basing them on the 9 months of data following the restructuring.
>
> What about the two years PRIOR to restructuring?

Different ballgame. Different license structure, different test requirements, different dynamics. And the FCC was renewing Tech Pluses as Tech Pluses back then.

> Go do
> the figures again and see the trends.

I have. The trends changed markedly after April 2000.

>Here, I'll do it for you.

Will this be as accurate as your earlier analysis? ;-)
>
> First three months of 2000: 163/month code-tested NEW
> licensees; 1980/month NEW Technicians. Not affected
> by April 15, 2000 restructuring.
>
> All of year 1999: 196/month code-tested NEW licensees;
> 1165/month non-code-tested NEW Technicians. Not
> affected by April 15, 2000 restructuring.
>
> All of year 1998: 265/month code-tested NEW licensees;
> 1231/month non-code-tested NEW Technicians. Not
> affected by April 15, 2000 restructuring.

Which tells us that most new hams start out with the Technician license - as I have written many times. Upgrades are not shown as new licenses in the Speroni data. Upgrades are not shown separately in the Speroni data, either.

And the restructuring DID have an effect. Once the NPRM was announced, hams and prospective hams who kept up with the news knew that changes were probably coming. Some of them would act accordingly, perhaps delaying upgrading until the new license structure was known. After the late December 1999 R&O, those thinking about getting licenses or upgrading knew what was on the way and acted accordingly. The exact effects can only be guessed at, but there WERE effects.

What do you think the above data says in terms of trends, beyond the fact that most new hams today start out as Technicians?

>
> > And it is
> >to be expected that the easiest-to-get license will have large
numbers
> >of licensees.
>
> The "easiest-to-get license" is a Restricted Radiotelephone
> License or Permit from the FCC.

Sorry, I made a mistake there. It should read:

"And it is to be expected that the easiest-to-get US amateur radio
license will have large numbers of licensees."

That's better. I apologize for being vague in that statement the first
time.

Your lack of reading comprehension is showing, Dick. Both Ed and I
encourage all hams to learn Morse code and use the CW mode which is
useful and fun for some. We will continue to encourage all hams to do
so even after the Morse code testing requirement is dropped entirely.

Naw, you didn't figure it out at all. I was in QSO when the PSker
landed on top of us and flailed away, clueless.

More to the point, he was doubtless running at minimum a pentium with a
million or so active devices, AND some sort of an elaboirate SSB
transciever. I on the other hand was (or easily could have been) running
my Tuna Tin Deuce and a single stage regen. So now who has the
efficiency edge?

Understanding the fundamentals is far from "We all gotta adopt the
latest yada yada yada" crap that is the Cecilian hue and cry, and to
which you clearly subscribe.

Really? So what're they doing on the phone asking you simple questions?
Kindly refrain from misrepresenting my viewpoint if you please. *I* DID.
"They" seem to resist any such activity, preferring to have "Ed do it"
for them.

Yep, CW requires many billions of active devices called brain cells
plus many hours of specialized training. Thousands VS billions plus
a short learning curve sounds like a fair trade to me, Dick. If you
don't believe in labor savings devices, why don't you ride a horse?

DSP is to ham radio now as SSB was to ham radio in the early 50s.

Undersampling, what else? It us reconstructed from samples with most of
the original and the noise absent.

Sure, they both said "Hey you dumbass hams better get your rears in
gear and get off that old mundane stuff, you're not doing our engineers
nor the rest of the economy any good by sticking with that old reliable
gear. You gotta do what the Maritime services did, get rid of that old
stuff and take up the new, hoswever flawed and no matter what complex
gear you have to get, so we can progress....."

Well? What were we supposed to get out of paragraphs of nonspecific
chatter that said essentially that in paraphrase?

> They are both telling Amateur Radio, each in their own way, that Amateur Radio
> needs to modernize.

When no such thing is needed in any way!!

Why do you think they are saying that? My interpretation
> is not that all hams need to become design engineers, but that hams should be
> making use of modern radio communications techniques within the Service.

And many DO! That is what shows that they will not be satisfied with anything that hams do. The Carl Stevensons and Cecil Moores out there are the root of it. Barely ever a ham at all, -hams have fun- they now can do little but bitch about what everyone but they are doing. For reasons known only to themselves FCC et all find themselves unable to effectively shrug off that sort of crap and instead we get nothing but criticism that we don't do all that they do! Looks like a terminal case of envy! We actually have fun with what we do. It's a shame they can't.

Actually, one generally has the option of removing uncorrelated noise or correlated noise. Removing uncorrelated noise works well for digital signals. Removing correlated noise works well for SSB. Noise is removed using adaptive digital filtering.

The great majority of hams are stuck in the 60s, Dick. We are already stagnating 40 years behind the state of the art in RF communications.

Yes, I do; CW can be done with a single active device on transmit.

How many active devices are inside the transmitter you use for CW? Let's assume 10,000 per IC and count from there. The microprocessors and RAM etc probably have quite a few more, but that will be offset by some of the IC amplifiers. Don't forget to count your keyer, if you use one.

True. But you could also tell them that you can look up how to do polar
conversions, and path loss calculations, and amplifier stage gains.

Maybe it's just a matter of opinion which things we need to know, and
which things we don't. Heck, isn't it true that everything on the ham
exams can be looked up?
I think one could point to almost anything on the exams and make an
argument that it didn't need to be there for the same reason you cite in
the instance of code. One would counter that argument by saying that
there is a reason for having that particular question on the exam. Are
you going to claim that there are absolutely zero reasons that can be
given for having the Morse code as part of amateur radio exams?

I don't agree with your statement for the most part.
>
> Electrons almost always are in atoms, and thus they take on
> discrete, quantized levels of energy which
> are definite and not random.

True.

> Heat is usually defined as the degree of randomness of motion
> of atoms.

Not exactly. You need to study cryogenics and what happens at super cold temperatures approaching absolute kelvanic zero where electron motion approaches a stand still. Is it any motion that is responsible for heat or is it heat that is responsible for any motion?...or is it both? is there truly any random motion?
> An electric current can cause electrons to move in a medium by
> jumping from atom to atom;

Wrong. You said yourself that electrons hardly ever leave the atoms that they are a part of.
Electro-chemical action such as electrolysis is perhaps the only example of an electric current moving atoms...not just electrons. The normal situation is not that electrons move from one atom to another but that they polarize the atoms in a dominio effect. The current does not "flow" either from positive to negative or from negative to positive, as is taught in most tech and high schools, but the atoms of conducting material become polarized and this polarization travels through the conductor at a speed approaching the speed of light.

> this causes essentially random
> motion in the atoms (say, in a resistor), and thus a rise in
> temperature.

The random motion is always there at ambient temperature. The random motion does contribute to noise if the conduction is part of the front end circuitry of a sensitive radio receiver, for example. In a MASAR the front end gets cooled by liquid nitrogen and this sharply reduces the random noise. The random motion does not cause the material to heat up to any temperature that is beyond the ambient temperature which caused it in the first place. The ambient temperature can however be considered as a reason for the electron agitation within atoms to exist.

> Removing the electric field leaves the atoms
> moving more randomly, but the electrons are not at all random
> in the reference frame of the atom with which each one is
> associated. If the atoms were not moving randomly, the
> electrons would not be, either.

The atoms do not move in most cases but the electrons in their outer orbits do become agitated.

> In a conductor, the
electrons (in the conduction
> band) hardly interact at all with any individual atom;

> little random momentum to the atoms; therefore, they don't
> heat it very much.

You start the above by disagreeing with what you wrote at the beginning, but here again your conclusion is wrong because you are not agreeing with Ohm's Law. Every conductor has a finite amount of

electrical resistance (even if it is 0.000001 Ohms). If an IR drop occurs in the conductor it must disipate some energy...Most of this energy is disapated in the form of heat, although some energy is in the form of an electro-magnetic field, since any conductor which has any dimention will have some field developed about itself. Thus if accurate measurements are made any conductor will show some rise in temperature when it is conducting any electrical current. The motion we are speaking of is not random...It is determined by the nature of the voltage which causes the current and will be very constantly direct or related to the frequency of such current, if it is AC or RF.

All of the basic physics and chemistry that we may be discussing here has little to do with RF hazards. The human hazard problems that may or may not exist at radio frequencies (HF, VHF, UHF) may not be complertly explained by a knowledge of how electrons act at DC. That is particularily why I believe that the thermal considerations are but the tip of an iceberg. Let me get back to the human eye, for example. We know that we can not safely look directly at the sun or other high level sources of light. This is not just to avoid the heat that the sun radiates. Intense light is harmful to our eyes...and our eye lids normally automatically protect us from prolonged exposure to direct intense light. We can wear sunglasses to avoid light glare when driving our cars. The glasses filter out some of the light. The better sunglasses are polaroid types which can filter out light of one polarity and pass light of a polarity that is 90 degrees different. We can not see RF...BUT Perhaps we may need to wear specially designed filter goggles when we use HTs. Goggles can probably be made, which can filter out the RF which can cause eye cancer. This would be better protection than a device which is currently marketed. The device absorbs some of the radiated RF and causes most cell phones to increase RF output to compensate for the device's attenuation in order to maintain communication. In my technical opinion such a device can only shorten the cell-phone battery life and has little or no effect on reducing any possible hazard.

Thanks for your comments...Although maybe neither of us are sheding much light (or RF) on the subject.

Hams need more license classes and maybe more physics classes as well.

Bob Wex w2ilp (I Learned Physics)

A man, visiting a crazy house, saw a man
who was trying to hammer a nail into
a wall head first. Another nut laughed
and said "If you want to do that, you
had better turn the hammer around".
Still another crazy inmate said,
"I know better! I was an engineer before
I wound up in this place. It is obvious
that that nail was designed only for use
in the opposite wall".
We all can understand that the nail
should be turned around...but if we
couldn't see the nail...such a project
(to show which way to hammer in nails)
could at least lead to a government grant.

Damned straight! My grandads team of horses and wagon got him into town just fine; wouldn't need these fancy cement roads, and there wouldn't be no damn Arabs taking all our money for some kinda refined decayed dinasoar muck. Never had to cross your fingers hopin' old Prince and Nelly would start on a cold morning.

Who needs this modern crap anyhow -- all this modern digital modem internet crapola is too complicated by far. At 15-cents a word Western Union got by just fine with some telegraph lines strung up along the railroad tracks and a kid on a bike delivering it right to your door -- why we gotta have all this satelite crap anyhow.

That's it exactly! Sounds like the TCS-8 mounted just above the coffee pot in Radio Central on a 2250-ton Gearing/Sumner class destroyer.

The TCS-8 back in Aux Radio went "pwaukty pwauktit pwauk pwauk pwipwauk".

Above 25WPM they both went "braaawwwwwwwkkkkkkkkkkkkkkkkkkkkkkkkkkk".

No ICs. Don't need 'em.

>The microprocessors and RAM etc
> probably have quite a few more, but that will be offset by some of the IC
> amplifiers.

No microprocessors. Don't need those either.

> Don't forget to count your keyer, if you use one.

I use a Vibroplex Original bug. Folks I work cannot tell its sending from a top-of-the-line keyer.

Let's see - entire HF station has a total of 20 active devices in the transceiver and a bunch of diodes and regulators in the power supplies and antenna tuner/SWR bridge. Puts 100+ watts of clean RF in the antenna, which is also homemade. Cost about a dollar a watt to build, not counting the antenna tuner, which cost maybe $20 and is good for several hundred watts. Clock is an old mechanical 24 hour digital (Timechron?) job made from the parts of three junkers. The shack table and shelves are also homemade.

It's not top-of-the-line but it does OK. HA1TG and UA3RF last night on 40 CW - the latter called me! And I can fix, align and modify it with no worries.

Fine! I guess balance scales cannot be in a process or a state of
"tip-ping" until they have tipped. Everything is static until,
suddenly, they are tipped. The balance beam cannot move until it
instantly comes in to a state of having been tipped. The beam cannot be
moving downward or upward.

The idea of tipping is impossible for you to grasp. I pity your
waitress.

I don't think any of those questions has ever come up on any of my job interviews, Jim. I am sure a prospective employer would judge which things, such as the ascii code, are reasonable not to be committed to memory and which things he or she expects an applicant to know. The FCC, through the QPC, does the very same thing (at least in theory); no amateur examination ever has contained all of the knowledge that a ham might acquire during a lifetime of hamming.

> I think one could point to almost anything on the exams and make an
> argument that it didn't need to be there for the same reason you cite in

I believe that amateur exams should contain the fundamentals of all that is relevant to amateur radio technology.

> Are you going to claim that there are absolutely zero reasons that can be
> given for having the Morse code as part of amateur radio exams?

I think not. My personal view is that Amateur testing should contain about 5 minutes of transmitted code and the applicant should be asked a reasonable number of questions (perhaps 2 or 3 in the General exam, as an example) about the content of what was sent. This should be part of the overall exam score. This would test Morse code the same way that all other aspects of Amateur Radio knowledge is tested.

I am sorry if I misunderstood your words, Dick. If you feel that telling
everyone here that learning new things is boring means that you want to
learn them, then I will take it that way if you say it again.

> What I said is that I have tried almost every new mode that came along
> and for the most part they are BORING! And yes, I "learned" new things
> about them, contrary to your assertion.

I think that you misunderstand what I mean by modern radiocommunications
techniques, Dick. PSK-31 isn't one of them. Just as one example, many
radio services use various spread-spectrum techniques to access an
information channel, not frequency channelization. How is that being used
in Amateur Radio today? How many hams understand the fundamentals of these
technologies?

> But I gotta tell ya, I prefer the old crystal filter to anything DSP has
offered to date.
> I'm on my fourth DSP and so far I see nothing but disappointment from any
of them.

Much of the difficulty with DSP in modern radios is in the way it is
implemented. There are major differences between the way that DSP is
integrated within or outside of the AGC loops in receivers, and in the
nature of the analog filtering before the DSP. At 12 or 16 bits, there just
isn't enough dynamic range in the DSP in most receivers to be able to handle
it all in software.

OTOH, "software defined radio" is the latest technique just now being
developed in modern radio design. Using DSP, a basic "black box" radio can
be reprogrammed to be anything from a CW rig to a CDMA transceiver. It is
our future, Dick, and I hope that not all hams find it "boring." We are apt
to see technology, and rules changes, that will accomodate this approach to

radio design, and in a few years, or decades, I expect to see DSP develop to the point where one goes directly from code (the software kind) to antenna.

> I also have a little audio autonotch filter that has had much more use against
> the carriers of the many RF spammer/jammers that all this infusion of

I have heard carriers since 1963, Dick. Don't go blaming it on all the "new blood." Of those busted by the FCC for intentional interference of late, what percentage of them were "new blood?"

> > If Amateur Radio were not in touch with the technology of the 40s, we would not

Gosh, Dick, you sure do see everything in extremes. How did we get from my belief that more hams need to learn more about modern communications techology to "we gotta change everything." It is very difficult to have a conversation if my words do not mean what words mean to you.

> Evidently FCC and most of the others who seem to be monitoring our

What about the repeater that is used once a month for a club meeting? Lose it? Why would one want to take on the administrative burden of trying to

keep hams off the air when there are technical solutions at hand?

Never be a need? I am sure there will be. There could come a need for me to ride a horse, too, but I don't think I will ever see a horse-riding test included with my driver's license. I think that society believes that if there is a need for me to ride a horse, I will get up on the fool thing somehow and pretty soon be a pretty good horse rider. There is a much more likihood that there will be a need for voice or data communication, and the best regulatory solution for that would be for the FCC to mandate that every ham station be equipped for voice communication on HF and VHF. If they are not willing to address that likely need through the rules, why would they address the need for Morse code communication through mandatory testing? Why do you select that one need and not feel that the FCC should do something to address a much more likely need?

> > I believe in the ability of hams to learn and grow. If more information

I used your word, Dick, in the context I thought you meant it. If you need to refresh your memory, do a deja search on yourself and the word "pause."

> I truly believe, indeed KNOW that this continued incessant demamding
> has caused many hams to abandon ham radio, just quit.

Why is it that my view that more hams need to learn more about modern radio technology is "incessant demanding" but your view that all hams need to pass a Morse code test is not? Your view has the force of law, while mine is just an opinion. Which do you feel is expressed more strongly? And if my opinion is enough to drive some away, what must the much stronger "opinion"

about Morse code testing do?

> You ARE taking your cues from Cecil. I rest on my laurals as a ham
> simply in that there are no more ham radio tests for me to take, the
> last one was over thirty years ago. If you believe that I haven't learnd
> anything since that time I'll just lump you in with Cecil, and surely
> you don't want to be there.

Of course I don't believe that of, Dick, but it is hard to interpret your calling my expression of the view that more hams should learn the fundamentals of modern radio technology as "incessant demanding." To me, that appears to say that you do not wish to learn the fundamentals of modern radio technology.

> If a few of you CW lovers whose real beliefs were not trumped by

> sheep.

Did you intend to be insultive there, Dick, or did you just get carried away? With all of those buzzwords, I am not sure what you mean by that paragraph, Dick, but I have very much been encouraging hams to use and enjoy Morse code. Claiming that I am not is, IMHO, appears to me to be an Agenda, too.

> You've got it backwards, again. It is not nearly as hard as they first

> the point. Why do you contradict it?

That's more like it; you are correct, learning Morse code is NOT a big hill to climb that will somehow prove their character. :-)

I subscribe to the concept that more hams need to learn the fundamentals of modern radio technology. You seem to be having a lot of difficulty understanding what that means. I can't think of another way to say it, Dick.

Some of the questions are pretty simple; many are not.

I think we have about beat this one to death, and I can't think of new ways to say the same things again and again. At least for now, the last word is yours.

Not a problem. I visited the public library after work today, I'm going
to the gun show tomorrow, and have a daytrip planned for St. Louis on
Sunday. Back to work Monday morning, will attend a seminar in Cleveland
on Thursday....

My kids like pokeyman. I've treated them to pokeyman toys, books,
videos, "snap" nintendo 64 game, and even a live show at the coleseum.

But pokeyman is still not the world's greatest hobby. Not by any
stretch.

Most of what appears in QST is written by outside authors. Care to write? ARRL pays. :-) I especially like the types of keys/advantages, though I can't speak for the editor. :-) See http://www.arrl.org/qst/aguide/#qst

> I've seen more QST articles on PSK31 in the past two years than
> articles on Morse in the past 20-30 years.

See the list at the end of this post.

> Of course the new modes need to be promoted, but when decades go by with
no attention to a popular
> mode, there's a problem. Newcomers do not have the ability to easily dig
up articles from 30-40 years ago.

As soon as Al, AA1DO, finishes a major indexing project, I will see what we can add to the TIS pages on Morse code. If you have any recommendations for the best articles, that may speed the process up a bit. :-)

> - Other ARRL publications: When I started out, there was an excellent

> Handbook" is needed now more than ever.

Try the following:

http://www.arrl.org/tis/info/frsteps.html
http://www.arrl.org/tis/info/antbegin.html
http://www.arrl.org/tis/info/antproj.html

http://www.arrl.org/tis/info/propagation.html
http://www.arrl.org/tis/info/rigbuy.html
http://www.arrl.org/tis/info/homebrew.html
http://www.arrl.org/tis/info/srvceqpt.html
http://www.arrl.org/tis/info/rfigen.html
http://www.arrl.org/tis/info/labnotes.html
http://www.arrl.org/tis/info/science.html

and of course, lots of other stuff at http://www.arrl.org/tis

When you look at the volume of stuff, you will probably agree that ARRL is quite committed to helping new hams get on the air and active, and the price is right. As to actual publications, there are:

Now You're Talking -- this study guide actually contains a lot of info designed to serve as a ham's first tutorial publication about setting up and using a station. Catalog #7970, http://www.arrl.org/catalog/lm/

Ditto on the other license manuals

Others. (See the catalog at http://www.arrl.org/catalog)
Ham Radio Made Easy
The Best of New Ham Companion
Understanding Basic Electronics
Ride the Airwaves with ALFA & ZULU (more oriented towards children)

> In similar fashion, the fifty cent "Learning The Radiotelegraph Code" booklet needs a new version
> that doesn't cost too much.

Code is best learned aurally. See Your Introduction to Morse Code cassettes and CD.

> Of course the N0HFF book on the MEGS site is excellent, and it's FREE for the

> A link only costs the work to put it on the site, doesn't it?

Agreed, and I will ask Al to do what can be done. Of late, too many tasks and too little Al. :-)

> - Things the BOD can do: It's interesting that the BOD changed the ARRL
> policy on S25.5 so quickly and so quietly, but that's a done deal.

The Board published their intent to consider S25.5 on the ARRL Web, in QST, in the ARRL Letter and in a W1AW bulletin. In what way was it done "quietly?"

<snippage> Some of your other suggestions have been sent to your Division Director, Bernie Fuller.

> Learning and using Morse is neither difficult nor time consuming for
> most people IF the right methods are used. But a new or prospective ham
> looking at the ARRL website or QST will have a hard time getting info
> on how to go about it, even though such information is readily
> available if you know where to look.

With the mandate from the Board to HQ staff to promote Morse code use on the bands, the ARRL Web site is a natural place to begin. I can do some of that on the Tech pages, not because that is the best place for the info, but because it the area for which I am King. (Ah, it is Good to be King!)

> And that's just my short list.

How about the long one? :-)

Nope, it's exactly what is wrong with ham radio today. I remember when
many hams were at the leading edge of communications technology. We
are still at that same edge but now it's the trailing edge.

Dick, it's the truth. A/Ds and processors are getting faster every year
and every year digital electronics takes over more and more of the
functions from analog by doing the job cheaper and better. Soon, everything
this side of the mixer will be DSP functions. The Kachina radio was just
the first of many.

On the contrary, I used NUMBERS of licensees based on FCC
databases. Those were the FACTS, facts available from the
only US agency granting amateur radio licenses.

A METAPHOR was used to indicate the TREND happening.

Kelley made a Big Thing out of the metaphor at first, didn't
say anything about the numbers or the trend.

>tested licensees.

I didn't mention at all the renewals of Tech-Plus to Tech because
the exact number of such renewals weren't listed except by
inference on the Speroni tabulation of Renewed licenses.

I did as stated, taking the overall monthly numbers of licensees in
each class, separating code-tested from non-code-tested..

I could have gone into an extensive "analysis" by including
numbers of Expirations of licenses (also tabulated) and doing
all sorts of second-guessing on the "why" of such. I did not.

The FCC renewal shift of Tech-Plus to Tech would put such
Tech-Plus licensees in the CODE-TESTED group, would it
not? The old Technician-Plus class required a code test for a
license. In order to separate code-tested from non-code-tested,
I made an additional posting regarding the 27 months between
the start of 1998 and the end of March 2000. That additional
listing excluded any "renewal" shifts from Tech-Plus to Tech.

The results are still the same -

The total number of code-tested US ARS licensees is decreasing.
The number of non-code-tested US ARS licensees is increasing.
It has been that way for over three years..

<snip>

>End result is that your numbers are way off.

No. I am not ASSUMING anything about "renewals" or expirations
or anything else, just showing the totals of code-tested versus
non-code-tested over the last two-plus years plus the number of
NEW licensees, code-tested versus non-code-tested.

If you start assuming some condition, your "analysis" changes
to mere SPECULATION. That is no longer any valid analysis.

>How do you know? What is faulty in my estimate? I clearly
>said "SUPPOSE" - that makes it hypothetical.

Speculation is still speculation. Such is not analysis.

>> Note the
>> tabulation of NEW licensees which increased at 1184 per
>> month for the 27 months between beginning of January 1998
>> and end of March 2000 for Technician.
>
>The actual numbers jump all over the place from month to month. And the
>tabulation is of new licenses, not new licensees.

An average per-month value based on 27 months totals, divided
by 27. In the 27 months there were 31,971 new non-code-tested
licenses granted and 6,009 new code-tested licenses granted.
If you are really picky about smoothing methods, feel free to
pick out any period you want...but quit trying to say "everything
is faulty." :-)

>The number of new Technician licenses proves one thing: Most people
>starting out in ham radio do so by getting a Technician license.

How do you KNOW that? All I see is the number of licenses granted
for particular classes. Aren't there any "Extra-out-of-the-box"
licensees? Aren't there any "General-out-of-the-box" licensees?

>The
>data does not tell how many of those new licensees later upgrade,
>because upgrades are lumped into "modifications".

None of the publicly-available FCC databases predicts the future.

Can you predict the future? I can't. I don't have crystal balls.

>> but the trend is for
>> NEW Tech licensees still growing after January 2001.

>
>That's an ESTIMATE on your part. Nobody knows what the renewal rate
>will be like until they actually start to expire.

Sure, trends are ESTIMATEs. :-) One plots past data and gets a
"curve" which may be a sort-of-straight line or something that is
curved. That estimate may be continued into the NEAR future for
a few months with some element of certainty.

It is better than picking fly droppings out of pepper to get the
number of Tech-Plusses renewed as Techs, the number of
Advanceds that were dropped to a lower grade for any reason,
or any number of "modifications." You can go to great lengths
to attempt "proving" something in the multi-tiered US amateur
licensing system. The only way you can REALLY "prove" your
numbers is to download the FCC databases yourself and make
your own search program to find EXACTLY what you are looking
for to show those #$%&!!! no-coders they are "all wrong." :-)

>That's simply not correct. I don't "wish" for a 5% dropout rate -
>I "wish" it would be 0%. The 5% is just a highly-educated guess, and
>identified as such.

Ah, "highly eductated!" Presumably there is some certificate or
diploma attesting to such ability? I'd still call it a plain GUESS
and lump it under speculation.

>By ignoring the fact that no Technician licenses have expired yet, your
>analysis is even more faulty. My estimate is closer to the facts than
>yours because it includes relevant corrections. My method is simply
>more accurate.

It is "more accurate" from the pro-coder's viewpoint. It is "more
accurate" because you said so. :-)

>It was identified as a "suppose". You ignored the whole expiration
>thing completely. My analysis is more correct because the relevant
>factors are included, and estimates identified as such.

It is "more accurate" from the pro-coder's viewpoint. It is "more
accurate" because you said so. :-)

>You have no idea how many will expire and how many will renew, either.

Absolutely true...and I NEVER PRESUMED TO KNOW THE
FUTURE. All I stated was a Trend based on PAST data.

>My estimates are accurate within the limits stated. My analysis is more
>accurate than yours. Much more accurate.

It is "more accurate" from the pro-coder's viewpoint. It is "more
accurate" because you said so. :-)

[doing good in the "nyah-nyah" department...:-)]

>The trend is that most new hams start out with Technician licenses.
>That's been the trend for over a decade. Some upgrade, some don't.
>Describing all Technicians as "non-code-tested licensees" is simply not
>correct or accurate.

The US Technician class amateur radio license test did NOT
include a morse code test element...ergo, the Technician class
license can be considered "non-code-tested." That is what I said.

>I'm not denying any trends. I'm just stating the facts and pointing out
>your errors. Which of my facts is not true?

Some of your "facts" were simply SPECULATIONS. One even
had the imprimateur of "highly educated." Speculations aren't
true or untrue, but they sure as hell aren't "facts."

>10 months of data are available, so why not include them? The longer
>the baseline, the more accurate the extrapolation or interpolation.

Oh, geez louise. Jim, if you want to Show The World The Errors
Of The Uncoded, go do your own arithmetic and post the results.

>Basing conclusions on the 10 months of data following the restructuring
>is, by definition, more accurate and correct than basing them on the 9
>months of data following the restructuring.

No sh*t? Is that from the "highly educated" school or something?

>> What about the two years PRIOR to restructuring?
>
>Different ballgame. Different license structure, different test
>requirements, different dynamics. And the FCC was renewing Tech Pluses
>as Tech Pluses back then.

No sh*t? In the period before restructuring too place, was there an
increase in the code-tested license numbers and a decrease in the
non-code-tested license numbers ???

>Which tells us that most new hams start out with the Technician
>license - as I have written many times. Upgrades are not shown as new
>licenses in the Speroni data. Upgrades are not shown separately in the
>Speroni data, either.

I don't think downgrades are shown either...but they exist in the
FCC database files. As I have suggested before, go download
your own database files and do searching for whatever data you
want to "prove" something. They are ASCII files and searchable
with a text-based search program.

>And the restructuring DID have an effect. Once the NPRM was announced,
>hams and prospective hams who kept up with the news knew that changes
>were probably coming. Some of them would act accordingly, perhaps
>delaying upgrading until the new license structure was known. After the
>late December 1999 R&O, those thinking about getting licenses or
>upgrading knew what was on the way and acted accordingly. The exact

>effects can only be guessed at, but there WERE effects.
>
>What do you think the above data says in terms of trends, beyond the
>fact that most new hams today start out as Technicians?

The above "data" paragraph is your own reporter-voice description. :-)

Not all new hams start out as Technicians. In the 27 months
between start of 1998 and end of March 2000 there were
1900 New Novice class licenses granted, 3,504 New Tech-Plus
licenses granted, 459 New Generals, 78 New Advanced, and 68
New Extra. Yes, Jim, "MOST" new hams probably DO start out
as Technician class licensees (they aren't all job technicians,
some may be engineers, housewives, plumbers, etc.). :-)

>"And it is to be expected that the easiest-to-get US amateur radio
>license will have large numbers of licensees."
>
>That's better. I apologize for being vague in that statement the first
>time.

Are you absolutely SURE of the first sentence above? After all,
the FCC is renewing Tech-Plusses who don't re-test on renewal
as Technicians, and "many" of the existing Techs will drop out,
and aliens might invade the earth to be repulsed by morse code.
Or at least repulsed by long-time morsemen who will fight
change (of any kind) to a moral, mortal end. :-)

My balls aren't made of crystal, therefore I can't know who many
are "in transition." [does operating mobile count? :-)]

Poor baby, really struggling for a slam there? Did I deliberately and
maliciously, with callous disregard of sensitive USAMCC feelings,
"make it appear that ONLY "new" Technicians are making an impact?"

You MUST say so, Steebie, because all you have left any more is
insult, belittlement, denigration, etc., etc.

All I did was post a comparison between the code-tested licensees
and the non-code-tested licensees in the US ARS.

If you feel that only the code-tested are "real hams" then you MUST
take the comparison as an insult.

>> Is it "belittling" that over 200 thousand no-code-test Techs are

>
> Only to you. Must chap your chops knowing there's all those teen
>and pre-teen ops out there able to do what you CAN'T do after your
>years aas a technician

See, there you go again, being uncivil, rude, insulting...sort of an
extra grade asshole. :-)

Steebie, I've been an ENGINEER doing electronics-radio design work
legally, titularly, and steadily employed as an ENGINEER beginning
in 1964. A whole host of federal agencies, several state agencies
all believed I was an ENGINEER. Fun jobs, all of them, paid fairly

well, too. Interesting work, some of it downright intriguing.

US amateur radio is not about being an engineer or not being an engineer...it isn't even about employment except that no licensee can use that license to gain income from it. Why do you keep insisting that I am a "technician?"

Note: Engineers are not required to learn morse code for engineering skills, diplomas, or titles.

According to Jim and Dickie you would be classified such. :-)

Denial is a powerful emotional survival skill. When threatened
in any form, especially about an avocational theological
concept, the denial syndrome makes them slightly crazy and
they refuse to admit it.

Part of the denial problem is a strong overlay of ego. If They do
something then "everyone else does it" or should. They climb up
on a pedestal and proclaim They are a role-model for otheres to
emulate. That's denial on afterburner.

I know how you got that idea. Ed said the Nokia engineer who programmed
the cell phone that beeps Morse could have just looked up the Morse, and
you took that to mean Ed thinks that amateur Morse testing should be via
look-up because, um.... well, because, er... I guess I *don't* know how
you got that idea!

n2ey@aol.com (N2EY) wrote:
>[What were the reasons that ham growth stopped dead in 1962?]

>SWLs could no longer easily listen in on ham QSOs, as they did in the AM days.

In 1959 as I recall it was still about half SSB, half AM. I don't
think AM was anywhere near gone by 1962. Further, most of the SW
receivers of the day had a BFO (even the cheapie $29.95 Heathkit AR-3)
which made SSB copy possible. I think that any SWL worth his salt
could still listen to hams...

>The cost and complexity of an SSB setup also had a negative effect
>on prospective hams by making it more expensive to get started on 'phone.

I think it was 1962 or 1963 when I bought my first SSB rig, a Heathkit
HW-22 40 meter monoband transceiver. The price was around $112 bucks
(I think - check your QST collection), in any case it was cheaper than
most of the AM stuff at the time...

>In 1963 the distance requirement was increased from 75 miles to 175 miles,

I could see this causing a 10% drop, but a "stop dead" drop??

>To add insult to injury, the FCC started charging fees of $4 to take the exam

Why would a small fee stop a prospective ham who likely will spend ten
times that amount on his radios...

>- CB: 27 MHz CB had been introduced a few years earlier, but by 1963 the number
>of CBers was greater than the number of hams, and growing fast. The equipment
>was inexpensive, the antennas small and simple, and there was no test at all.

This is certainly a possible reason. Most of the fun of ham radio
without the test. Food for thought: Did CB do to ham radio in the 60s
what the Internet is doing to ham radio today...

>- Cultural changes: ... Very few hams of '60s looked like
>John Lennon or even Austin Powers.

You think that incentive licensing increased the numbers by making
hams look better?? :-)

>TV watching increased all through the '50s and '60s.

How does that explain the sudden stop in '62?

>- Economic conditions: For some reason, ham radio tends to grow more during
>periods of bad economic conditions than during good ones,

Were we in a recession in 1962? I forget...

>Waddya think?

Interesting thoughts Jim. It doesn't seem logical to me for most of these things to account for zero growth, except maybe the CB thing. But I sure don't have any other ideas. In fact I wasn't even aware of the 1962 growth cessation. Thanks for the insight, it was an interesting read...

There was still some AM in 65-66, when I started listening. But there was far more SSB.

> Further, most of the SW
>receivers of the day had a BFO (even the cheapie $29.95 Heathkit AR-3)
>which made SSB copy possible.

IF you knew how to work it. Many SWLs did not.

>I think that any SWL worth his salt
>could still listen to hams...

IF their receivers had BFOs and IF they knew how to work them. And if the cheap SWL rx stayed on frequency long enough to copy anything. Point is, it was not nearly so easy to listen to hams on SSB with the SWL sets of the time as it was to listen to hams using AM. That's just as true today.
>
>>The cost and complexity of an SSB setup also had a negative effect

It was $112 bucks or so for the rig itself, then another $30-40 for the power supply. And what you got was an SSB-only monoband rig that needed a 1:1 SWR (or close to it) to work.

On the other hand, a Novice could add a modulator to his MOPA CW rig and go on AM easily and cheaply. Some folks used cathode or screen modulation, which could be added for almost nothing. Sure, the efficiency was awful, but it got

ya started.
>
>>In 1963 the distance requirement was increased from 75 miles to 175 miles,
>
>I could see this causing a 10% drop, but a "stop dead" drop??

Not this reason alone, of course, but it made a dent. None of these reasons alone caused the stop, but each one made a dent. The sun of all of the dents added up to no growth.
>
>>To add insult to injury, the FCC started charging fees of $4 to take the
>exam
>
>Why would a small fee stop a prospective ham who likely will spend ten
>times that amount on his radios...

$4 was not a small fee in 1963. Many newcomers were teenagers, and the minimum wage was maybe $1. So we're talking 4-5 hours minimum wage to take the test, pass or fail. What's 4-5 hours of minimum wage today? More than $20.

Again, it made a dent. Add it to the 175 mile trip, and it gets costly fast.
>

Of course it did. The cheap walkie talkies kids got for Xmas helped feed the frenzy, too. Many kids I knew back then talked their parents into getting CB setups, which they then used. For less than $150 you could have a complete 23 channel CB setup, with antenna, coax, the works. No license, no tests, no nothing. And you could blame the TVI on the ham down the street.
>
>>- Cultural changes: ... Very few hams of '60s looked like

>How does that explain the sudden stop in '62?

It made a dent. And the teenagers of 1962 had been born in the postwar years and grown up with TV.
>
>>- Economic conditions: For some reason, ham radio tends to grow more during
>>periods of bad economic conditions than during good ones,
>
>Were we in a recession in 1962? I forget...

Just the opposite. The '60s were boom times. The recession and inflation came later, as the deficit spending of the Johnson and Nixon administrations caught up with us. Then the oil embargoes hit...
>
>>Waddya think?
>
>Interesting thoughts Jim. It doesn't seem logical to me for most of
>these things to account for zero growth, except maybe the CB thing.

Each one had an impact. If you have five items and four of them take 5% and one takes 25% of the growth, there goes 45% of your newcomers.

>But I sure don't have any other ideas. In fact I wasn't even aware of
>the 1962 growth cessation. Thanks for the insight, it was an
>interesting read...

You're welcome. Some folks moaned back then that "ham radio was dying" because there were only 250,000 hams and they were all getting older. And the new gear was too complex, the tests were too hard, the ARRL was ruining everything, etc., etc. Sound familiar?

It was not. Even by 1968, AM was far from dead in the Amateur Radio
Service.

> Further, most of the SW receivers of the day had a BFO (even the cheapie
$29.95 Heathkit AR-3)
> which made SSB copy possible. I think that any SWL worth his salt could
still listen to hams...

My SWLing was with an old Zenith Transoceanic receiver. I don't recall it
having a BFO.

> I think it was 1962 or 1963 when I bought my first SSB rig, a Heathkit
> HW-22 40 meter monoband transceiver. The price was around $112 bucks
> (I think - check your QST collection), in any case it was cheaper than
> most of the AM stuff at the time...

I bought my used DX-40 for about $35.00, and later a used DX-100 for $75.00.
The DX-100 modulator made a great guitar amp. :-)

> Why would a small fee stop a prospective ham who likely will spend ten
> times that amount on his radios...

Most commercial HF transceivers today cost about $1000, in round numbers.
Lets assume the average ham spends another $1000 on the rest of his or her
station. Would a "small fee" of $100 today, to take the conservative
number, based on your 10%, stop a number of people from becoming hams?

> This is certainly a possible reason. Most of the fun of ham radio
> without the test. Food for thought: Did CB do to ham radio in the 60s
> what the Internet is doing to ham radio today...

What percentage of those CBers went on to become hams? I did.

> >TV watching increased all through the '50s and '60s.

> How does that explain the sudden stop in '62?

And TV watching increased through the 70s and 80s, too, a time of steady
growth in amateur radio.

I was a maritime shipboard radio officer many years ago, and can't
resist passing on to the more recent folks, a couple of Q signals
that also were not in the books, but were quite commonly encountered:

QWC - "Water Closet" the British equivalent of toilet; in other words,
I will be away from the key for a moment or so......

QLF - Please send with your left foot; your right foot sounds tired.

While it may not have the endurance as others you've mentioned, Pokemon is a major obsession with many people. As the fad passes, it will probably be regulated to comic book and/or sports card shows, where such collectables thrive.

Besides, when I posted my original comment, I was being facetious, so lighten up!

Tentec also sells both an HF and a VHF transceiver that work this way.
Tentec's shortwave receivers also use DSPs for everything from IF
to audio, as does the JRC NRD-545. Watkins-Johnson sold the first
receiver I was aware of that did this, but they've since gone out
of the business.

For transmitters it is in principle possible to avoid mixing stages
altogether, instead generating the modulated RF directly using a
DDS chip as the DSP's output device. Unfortunately, I discovered that
the outputs of current DDS chips can have more spurs than a Texas saloon,
so this may need to wait for another generation of the technology.

A double break ("break, break") or triple break used to be used to
indicate priority or emergency traffic. The FCC doesn't have any
guidelines on the matter.

With freedom, comes responsibilty. Freebanders aren't acting responsible
when they interfere with other communications services. It's the "yelling fire"
cliche.

I do, however, have a problem with the FCC telling me what topics I may or may
not talk about. Example: During an interview several years ago, an FCC official
said that discussing controversial subjects over the amateur frequencies
basically violated 97.1(e), because such subjects, as he put it, "did nothing
to enhance international good will."

This is a regional thing. I don't remember any SSB CB'ers using "contact" instead of "break" in the 70's (Washington, California, or North Carolina). And I haven't heard a single ham operator around here using it today, but I did hear it one time in Washington state recently.

Because it is so regional in nature, I really don't think we can so easily blame this on "those CB'ers." Instead, I suspect this is coming from somewhere within the ham community itself, or coming from plain language outside of radio.

> When I want to break in, I just give my
> call letters. It gets the job done, and

Most people do that, but I don't know how much it really saves time by letting people know who's breaking in. In my case, unless I already know the person (and callsign), I rarely ever catch the callsign of those breaking in this way.

This new "only US agency granting amateur radio licenses" thing is
beginning to sound tedious. Do you believe that anyone here doesn't
know that the FCC grants amateur licenses? If you follow procedure, you
can get one too. Good luck with the exam.

>But I thought CW gets through when no other mode will. Is that true only if
>the other mode is not allowed to be used?

Ed:

I don't recall ever reading or hearing anyone say that CW gets through even in the presence of overpowering QRM from signals of other modes. A .5 Watt CW signal can be heard and understood under extremely adverse conditions -- conditions which would make a phone signal at a similar power level hopelessly unreadable. However, this same CW signal, when wedged between high-powered, over-modulated, over-compressed, over-everything'd phone signals, won't be heard at all. Now -- a similarly powered CW signal would probably get through just fine, in spite of the QRM -- but one of the main benefits of CW is to be able to avoid using high power.

In any scenario where CW subbands are shared with phone signals, CW will tend to lose out. Its only natural.

Nor can you speak for people who willingly embrace a challenge and go out and achieve a worthwhile accomplishment instead of whining that the rules have been changed! I never could understand the post-Incentive Licensing General and Advanced licensees that refused to upgrade to Extra, except for the fact that most of them are primarily phone operators! I wonder -- if the FCC had grandfathered them with Extra-class phone privileges, would the whining have subsided? I'll bet it would!

I believe the FCC should always make liberal use of grandfathering of privileges, just so hams like myself, who don't have a problem accepting a challenge, don't have to be bothered to listen to the whining!

>tested?

Ed:

I would say that their objections to the way Morse code is tested
sounds a lot like whining -- as it always does!

>> However, its a moot point now. Pretty soon we'll have the beepless ARS
>you've always dreamed about.
>
>I do not believe that Morse code use will end any time soon, Larry.

Notice, one and all, that Ed didn't say that its use would NOT come
to an end -- which it certainly will now that the testing requirement is
all but gone.

>Do you
>feel that the mode has so little value to ham radio that no one will learn
>it and use it unless it is tested?

Asked and answered, many times. Whether or not people will learn
and use the Morse code in the absence of testing has nothing to do
with its value -- the testing requirement provided the incentive to
learn Morse code at a useful level. I did not learn the Morse code
due to the "usefulness" of this mode, which I was certainly not
interested in at the time. That usefulness was made clear to me
only after I gained fairly good proficiency in using the mode. The
requirement is what kept the mode alive. I dare you to gather 30
prospective new hams, none of whom have been exposed to any
part of the hobby beforehand, for the purpose of "Elmering" them
into the hobby from scratch, and end up with more than two of
them becoming proficient (capable of handling message traffic at
18 WPM) CW operators with no *requirement* that they do so. It
is impossible. That was not conjecture; that is a statement of
absolute fact. I'd be more than willing to bet that what you'd end
up with is ZERO.

>I disagree; all of the other modes have
>avid proponents without such testing.

And none of these other modes require the physical development of
an operating skill which requires a great deal of personal motivation,
dedication, and perseverence to master. Hell, the majority of hams
utilizing "high-speed digital modes" can't even get a message out
without the use of pre-programmed buffers. If you want to discuss
replacing CW tests with high-speed (> 40 WPM) typing tests, then
maybe we can reach some sort of compromise!

>I do not agree with you that those
>modes that use code are the bottom of the pile.

Well, then, Ed, I guess you'll have to disagree with me then. This
is America -- disagreement is allowed. Of course, in this case,
disagreeing with me makes you wrong, but that's *your* problem!

Well, Ed, you admitted it up front in the signature to a message body. Some others have to have their occupational information squeezed out, sort of like whacking the old glass bottles of ketchup to get anything. :-)

BTW, I have nothing at all against what the ARRL does as services. It does PLENTY of them and amateurs should be more grateful for such. My only dispute is with some of the ARRL's policy decisions...which is coming around from their 1930's standards and practices basis slowly. :-)

You get paid in pornography? My, my, that IS a cushy job!

> I am sure that would make you happy...AND give you more
>opportunity to spread your decitful and lecherous tripe completely
>unchecked.

"Deceitful and LECHEROUS tripe?!?" Oh, my!

First of all, the information I've presented in public here can be verified by anyone else accessing www.state.tn.us or www.state.ga.us and then following the buttons to get to LPN license registry. [Georgia's a bit harder to get to than Tennessee, but that was just for getting to the license search pages] No "deceit" there.

I'm not certain what is meant by "lecherous tripe." A "lecher" is a lewd, grossly sexual man according to my handy Websters. "Tripe" has two definitions, one of which is the lining of the stomach and intestines, colloquially known as the "gut." :-) That would imply "lecherous tripe" as being something sexual involving guts. :-) :-) :-)

Maybe humorist Dave Barry could make more of this but I'm laughing too hard to type more...!

Not at all. Having a second residence for yourself gives you
some free time to do as you wish.

>> Driving 6 hours a day? Doing e-mail and newsgrouping from
>> one of those jobs? Which one?
>
> Actually, it's three hours on Monday and three on Friday. The
>nursing's in the middle when I choose to take an Agency shift.

Better get in contact with Macon, GA, and renew Georgia LPN
certificate #52241 since it expires 03/31/01. It was first taken
out on 07/12/95. No problem on the Tennessee LPN license
#49513 since that won't expire until September 30, 2001. :-)
[original issue 1 November 1994]

That took only a few minutes going through state websites
However, those state websites do not reveal whether or not
a licensee is actually USING those licenses for nursing.
Anyone who is proud of what they do should be able to
tell one and all what the license numbers are and where
they can be found. It's in public view and listed by a state
agency. :-)

Previously, Robeson stated that he took the purchasing agent
job because of "burn-out" from nursing. Now it is revealed that
he works as some kind of temp (?) nurse after regular company
hours? Inconsistency there or a lack of full explanation.

There is also some curiosity as to why someone has to travel
about 170 miles or so (3 hours driving time) away from home
when there most certainly are some electronics-radio related
companies in the Tennessee area closer to Dunlap.

>> If someone posts an uncivil message, they might get a reply
>> IN KIND. Those are deserving. I've never said otherwise.
>

n2ey@aol.com (N2EY) wrote:
>it was not nearly so easy to listen to hams on SSB with the SWL sets of
>the time as it was to listen to hams using AM.

If an SWL couldn't figure out how to use a BFO to listen to SSB I
doubt that he would make it as a ham back then...

>It was $112 bucks or so for the rig itself,
>then another $30-40 for the power supply.

I didn't get the power supply. I made one from old TV set parts. It
sported a couple of 5U4s. Great regulation... :-)

>And what you got was an SSB-only monoband rig

I bought some parts (crystals and coils) from Heathkit that were
designed for the 80 and 20 meter models. I used a few switches and
presto it was a tri-band rig: 80, 40 and 20 meters...

>that needed a 1:1 SWR (or close to it) to work.

That was easily solved by putting a broadcast receiver type 360
micky-mike (remember that word?) variable cap across the output which
made it into a pi net, and then it would load almost anything...

>On the other hand, a Novice could add a modulator to his MOPA CW rig and go on
>AM easily and cheaply.

I'll agree that AM was cheaper (using used old used gear). I was just
saying that SSB didn't have to be all that expensive...

>Some folks used cathode or screen modulation, which
>could be added for almost nothing. Sure, the efficiency was awful, but it got

Remember the old Heathkit DX35 and it's "controlled carrier" (screen)
modulation? I think it measured in the neighborhood of 25 watts AM.
That really didn't cut it...

>$4 was not a small fee in 1963. Many newcomers were teenagers, and the minimum
>wage was maybe $1. So we're talking 4-5 hours minimum wage to take the test,
>pass or fail. What's 4-5 hours of minimum wage today? More than $20.

Do you really think that $20 would stop a teenager today from becoming
a ham if that's what he wanted? Have you priced some of the teenage
toys these days...

BTW I was making $88.25 a week at Motorola in 1963 with a wife and
soon to be kid. That $112 for the SSB rig was hard to cough up, but
heck what's more important anyway... :-)

>how many hams do you think went to Woodstock?

Dunno. But I think the Woodstock populace might be an improvement over
some of the characters I see at the ham swapmeets here... :-)

>Some folks moaned back then that "ham radio was dying" because
>there were only 250,000 hams and they were all getting older. And the new gear
>was too complex, the tests were too hard, the ARRL was ruining everything,
>etc., etc. Sound familiar?

Yeah, but it's all true now,
(except for the tests being hard)... :-)

Well Ed, the resourceful kids/SWLs of my youth used to place a broadcast receiver physically next to the BFO-less SW receiver. Then you tuned the broadcast receiver until it's oscillator beat (in the IF) with the signal on the SW receiver. Worked great...

>Most commercial HF transceivers today cost about $1000, in round numbers.
>Lets assume the average ham spends another $1000 on the rest of his or her
>station. Would a "small fee" of $100 today, to take the conservative
>number, based on your 10%, stop a number of people from becoming hams?

If they planned to buy a $1000 dollar rig, I doubt that even a $100 dollars would stop them. I pay a fee of $240 a year for internet service. My laptop cost $1300. If this machine has a useful 4 year life, I will have paid around 75% of my hardware costs in fees. I suspect that many teenagers pay as I do for the net, so why not a small 10$ a year ($100 fee/ license term) fee for hamming if that was their desire...

>What percentage of those CBers went on to become hams? I did.

What percentage of hams became CBers? Everybody I knew in the 60s did. We all got those nifty call letters/numbers... :-)

Apparently, according to Hans, FISTS members work you once, get your
number, and are more than happy to send you on your way. Can it be than
idiots can pick up a paddle?

No you don't. You do your damned best to create a few.

> You've done nothing of the kind, only shot off your keyboard again.

Keep telling yourself that, Lennie. I am sue it makes you feel
good THINKING that.

> Try to concentrate on the facts of what is happening to others, by
> others, especially concerning newcomers to US amateur radio.

As an ACTIVE licensee I am acutely aware of more than YOU will
know. You should try it sometime.

HOW MANY antennas have you helped erect for "newcomers" in the
last 30 days, Lennie?

HOW MANY VE sessions have you proctored?

HOW MANY nets have you participated in that introduced "new hams".
Lennie?

I can assure you that the answer in MY case exceeds "1" by a large
margin in EACH of the above cases.

Which in only ONE month exceeds your total for the DECADE.

Adios, Chump. Get a life.

Lenni, almost every post you make is intended to insult or troll.
The first post of this thread is pure proof of that. It had absolutely
NOTHING to do with the implementation of ANY policy. Just your
attempts to further incite discontent.

> You MUST say so, Steebie, because all you have left any more is
> insult, belittlement, denigration, etc., etc.

Hmmmm....call me "Steebie" (pablum caught in your dentures again?)
and THEN attempt to cahstise ME for "insult(s), belittlement,
denigration, etc, etc"...?!?!?

If THAT'S not pure Lennism, I don't know what is... ! ! !

> All I did was post a comparison between the code-tested licensees
> and the non-code-tested licensees in the US ARS.

No what you did was troll. You succeeded.

> If you feel that only the code-tested are "real hams" then you MUST
> take the comparison as an insult.

You ATTEMPT to ask one of those "Do you LIKE having sex with your
sister" questions. Of course they are "real hams". The "arguement" is
NOT are they real hams, but are YOUR numbers valid. THAT answer is NO.

> See, there you go again, being uncivil, rude, insulting...sort of an
> extra grade asshole.

And now the resulting profanity.

> Steebie, I've been an ENGINEER ...(SNIP)

And WE (yes, WE) DON'T CARE! NONE of that makes a didly squat
difference because THIS NG is about HAM radio...NOT "Ex Engineers With
A Chip On Thier Shoulders".

Of course if we created an NG just FOR those persons, you'd
pretty much be talking to yourself.

> Why do you keep insisting that I am a "technician?"

Probably for the same reason YOU keep lying, using profanity and
generally being an annoying little twerp. Because I CAN.

> Note: Engineers are not required to learn morse code for
> engineering skills, diplomas, or titles.

Who said they had to?

> Gosh, thanks, Sancho Panza! Now get on your ass and follow
> your Don to the next windmill.

I am not the one jousting the windmill, Lennie. That's YOUR claim
to fame.

> PS: Good going, Steebie, you got in early to work to post e-mail
> at 7:48 AM.

You have done ONE positive thing for me, Lenni. I will not retire
until I just can't go on any longer. If all you can do is check date-
time-groups to find some percieved impropriety in when/how someone
responds to YOUR tripe, then I guess there's not much left to do in
life.

Maybe you should write a letter to Uncle Jack in care of the
Michigan Department of Corrections and see if he can make any
suggestions, in as much as he's out of service at the moment. Since
you have lost all remaining vestiges of productive life, I am sure
he'll be glad to usher you to the next life.

You missed Arkansas licensure, too, although that one's been
inactive a while. Not to mention EMS certifications in four states,
FAA licensure (albiet not professional) and numerous endorsements from
the AHA, ARC, other agencies that I am sure you might recognize.

> Is it on a website or printed in a written document?

What part of "public information" don't you undersatnd, Lennie.
Believe it or not, the presence or lack of presence on the Internet
does not substantiate validity. You are invited to contact TAG
Tennessee and find out for yourself.

> First of all, the information I've presented in public here can be

> license registry. [Georgia's a bit harder to get to than
> Tennessee, but that was just for getting to the license search
> pages] No "deceit" there.

Hmmmm.....now I am wondering what MY licensure as a nurse in ANY
state has to do with your trolling in Amateur Radio related
newsgroups...?!?! THIS is an interesting stretch, and a sorrowful one
for you to follow in order to deflect from the fact that you have been
bested by Hams again.

> I'm not certain what is meant by "lecherous tripe." A "lecher"

I said I took the job to "take a break", Lennie...NOT to
completely disassociate myself. Of course, not having never held a job
that had such responsiblity, I doubt you can "relate".

> There is also some curiosity as to why someone has to travel

"Admit", Lennie? This is an interrogation..?!?!

As for the club call.it HAS been discussed here before. I forget
the other party, but I was asked if I was going to acquire a handful
like some have. My answer then (as it is now) just one is enough and
it's there for all to see.

Even you, Oh Licenseless One.

> with my wife who was on a trip up north. He didn't get any
> "satisfaction" out of DEMANDING to break in. His royal
> hynie hasn't been the same since.

No, Lennie, acutally by not blocking your IM's to others, you are
patently allowing others to "enter" the conversation. It's only when
you block the IM's or say "I am busy right now" (or words to the effect
of "get lost") that an incursion has occured. You COULD have "allowed"
only your wife's (or other specific friends or families) screen name
while blocking others, but you didn't.

Actually, I think there was probably no such "emergency", and that
this is just some make-believe "event" conjured to further substantiate
the victim role. Otherwise you would have been civil enough to at
least express the circumstances. "Family emergency. Can't talk.
Sorry" Thirty six keystrokes in all, less than 10 seconds. Your "wife"
wouldn't have noticed you were "gone".

But I see you are CLINGING to the "victim" role. At least you are
consistent

> What your employer does is your employer's business. Since
> you've never admitted to working for them before, I doubt you
> care much for them...but that is between you and your employer.

What I don't care for much are liars who insist on defaming that
which I have enjoyed for three decades.

A situation containing incongruity is funny. We laugh at the
incongruous. You occasionally make me laugh, Len. I'm positive that
the humor isn't intentional on your part.

> A Dave Barry you AIN'T...!
>
> didit

I dunno, Len. Dave Barry is a minister's son. I'm a minister's son.
Dave Barry plays guitar. I play guitar. Then there is the Miami
connection. Oh yeah--we're both named "Dave". My sister's kid played
the older boy in the "Dave's World" series. That should be enough to
set you off on a round of cyber sleuthing.

Do you know much about amateur radio? Fill us in.

Dave K8MN

>Have you ever worked a no-coder on VHF/CW?

That is not a better question in the context of the original premise that if no-code folks are allowed to use CW without being tested, they will foul our nest. I think my original question is more apropos.

Your question, however, is a good answer to my question. The answer is that I don't think so. This pretty much demonstrates that people don't operate Morse code unless they know the code, so they won't be causing anyone to "stumble" over they on "our" bands.

"Privatization" was the governement buzzword of the era. I think that the major social forces that were sweeping the country were a bit more influential on the FCC's decision than the fact that one ham published some reasonable accurate "question pools."

>landed on top of us and flailed away, clueless.

If he was able to conduct his QSO, you were outside of his necessary bandwidth. He was probably outside of yours, but many hams cannot copy a CW signal if another signal is less than 100 Hz away from the station they are trying to listen to. I am good for about 20 Hz separation on a good day, but I find it very fatiguing and I don't enjoy it.

Now, you have cited a case where a PSK-31 signal jumped on top of you. How many times has that happened compared the number of times that another CW signal jumped on top of you.

Just to keep track, I thought we could use a list of classes of people
that irritate Larry, as evidenced by recent NG postings:

(1) Hams who haven't taken a code test (e.g., not "Real Hams").
(2) Hams who have an Extra without a 20 WPM test (e.g., "PseudoExtras").
(3) People who think (1) and (2) are real hams/Extras (e.g.,
"Politically Correct whiners").
(4) Ten-Ten members. ("Collectively, proof that any idiot can pick up a
microphone and talk.")
(5) Everyone at ARRL HQ except Ed (although stay tuned: Ed is teetering
on the brink).
(6) "The majority of hams utilizing 'high-speed digital modes.'"
(7) "People hired under Affirmative Action programs."
...more to come, no doubt. That's only a couple days' worth.

We could shorten the list dramatically by just making it:
(1) Anyone who's not Larry.
But that wouldn't be as much fun!

Jon

Nothing said about it in the ARRL HQ rumor mill, nor were there any memos that if Larry shows up at HQ we should all hit him with a stick. In fact, such activities are pretty much forbidden by some general policy in the ARRL HQ employees manual.

Not many PN junctions in a Vibroplex or J38!

But we all know that none of those many active devices are necessary to
run radiotelegraphy, don't we? It really in thoughtful of manufacturers
to see to it that CW mode is preserved on all these newly manufactured
rigs, though, they must know what Real Hams like.

As you well know by now, so do I- Just as long as they don't jump
right over and bypass the basic modes as well.

If one wished to maintain the communications mode which would be
likely to be useable under the widest range of situations and
conditions, would he not decide to keep the most universally available,
easily implemented mode, at least as a reserve? Why is that so obscure a
point ot view to so many techies? Agenda time again?

I sereiously doubt it. You meet and converse with seek out your
services and those of ARRL. For every one you contact there are many
thousands you never know about. No one I know personally has had contact
with you. ARRL memebeship amounts to less than 25% of US hams. I don't
think you know that much about the majority of them.

I'm afraid the facts are, pretty much as always regardless of your
selective memorizing, that the engineer-hobbyists who are also hams will
-again; as always, be1 the portion of ham who do "leading edge" design.
It has never been different except that once it was much easier for an
ordinary individual to learn to be a communications (radio) engineer.

And the output of the Kachina is undistinguishable from a non-DSP rig.
You say we must do it because someone can. Not because there is any
compelling reason, such as was the case when SSB surperseded AM. Anyone
who listened to 75 meters in the AM days when the band was a massive
series of heterodyne squeals as cinoared with the relative order of SSB
there later knows. There is simply no way to compare that change with
DSP.

You're not telling me anything I don't alrady know. You *are* showing
how ham radio is being morphed into just another internet style
gabblegibberish mishmash. About the same thing happened to VHF packet
radio, and was gthe exact reason I and many others abandoned it. All the
"visioaries" insisted on converting it into something virtually useless
and at once dull and uninteresting, just to persue some elusive uneeded
"efficiencies" which mean nothing whatever to the individual ham radio
operator and only served the agendas of the perpetrators.
No one **EVER** suggested that hams should refrain from learning about
new technolies, and code supporters have repeatedly stated that from the
outset, along with strong support for current modern tests. WE DO RESIST
the continued assertion that we must "modernize" by dumnping everything
that interests us just because it might have been around longer than the
latest digital dream. We've listed dozens of other objects which are
also obsolete, and are still in universal use today, but that makes no
difference.

It is clear that the entire movement to "modernize" is nothing more
than another push to get rid of the code. And a very lame one at that.

We are already modernized. And we refuse to be intimidated or browbeat
by those who want their agenda to prevail.

Why would you say that, Larry. Ed and I have nothing to whine about.

> Whether or not people will learn

What a strangely false statement, Larry. If Morse code has enough value,
of course people will learn and use it.

> And none of these other modes require the physical development of
> an operating skill which requires a great deal of personal motivation,
> dedication, and perseverence to master.

So you are saying the value of the return on investment for Morse code
is too low for the cost/effort involved. You might be right, Larry, but
Ed and I disagree with you. Only time will tell.

I am primarily an experimenter and rarely operate. Most of the hams
I know who are primarily experimenters were Advanced class hams.
There simply was no need for an Extra license.

Just shows how little you know about human psychology, Larry.
Anyone who gets annoyed on a news group is choosing to be
annoyed. The basic question is: Why do you choose to allow
people to annoy you on a news group?

> you saying I am in?

No I have NOT disagreed with you, rather I have agreed with you. But I gotta tell you-- If ARRL(or anyone else) wants any serious numbers of hams to learn the advanced techniques it will take more than just haranguing and a few references in the Handbook to do it. There must be an effort that involves a lot more than lip service. I'd suggest the BOD start a true basic level educational initiative to do just that. Start by cocmparing the basic level differences with a a conventional superhet then a ground-up model of a DSP radio transciever, on the most basic operational level that will function, then publissh the whole thing in a series of magazine articles- and NOT in QEX. Most of the hams who are not techies don't get QEX. A book wouldn't hurt a thing. With all the yelling at us that goes on here SURELY there are plenty of experts that could handle this in stride - aren't there?????

Bottom line, all this noise is just that so long as it isn't followed by actual movement to accomplish. It really becomes mundane, all the "we gotta modernize" stuff with nothing to back it up.

I haven't looked at the Tech exam but I seriously doubt that it is easier
than the Novice exam I took in 1951 which was based on only 33 total Q&A
in the ARRL License Manual. I memorized it in two hours.

The great majority of people who don't know Morse code don't consider
it to be universal or easily implemented. If you want to use Morse code
for emergencies, Dick, by all means do it. Most of the rest of the world
has given up on Morse code for emergency use.

So we hams should deliberately become a case of arrested development in the electronic dark ages?

> It is clear that the entire movement to "modernize" is nothing more
> than another push to get rid of the code. And a very lame one at that.

No one wants to get rid of the code, only the code tests. What we are advocating is that hams know as much about modern modes as they know about CW.

> We are already modernized. And we refuse to be intimidated or browbeat
> by those who want their agenda to prevail.

Spoken like a true knuckle-dragging Neanderthal, Dick. Latest theory is that the Neanderthals were absorbed into the Homo Sapien line. You seen to have got the majority of their genes. :-)

????? Wake up, Ed. He compared a 5 watt CW signal with a KW SSB. Then he said one major advantage of CW is the fact that you don't need high power, while most of the SSBers use it anyway, words to that effect. That means that CW is the less robust mode? When you can clearly copy a CW signal at levels where SSB voice is totally unintelligible? Fellow, you're beginning to sound like this is getting to you, you're losing your technical edge. Why?

As a design electronics engineer, I've had as much responsibility
as any other design electronics engineer. That can run to
several tens of million dollars on a project. You can find my
name in the approval sign-off block for the drawings of the
AN/ASM-416 Test Set, as one example.

How can you possibly "know" what I've done in the aerospace
community over the last 46 years? Have you checked with my
past employers? I gave you a list of them. Have you checked
with the two radio amateurs who I've included as personal
references? Have you bothered checking anything at all?

I don't think so. All you did was make a blanket accusation
cum insult based on personal rage. Tsk, tsk, not nice.

Chatanooga has no electronics industry? Nothing closer than
3 hours distance? Seems strange considering the east coasters
have been bragging for years about being the center for all the
"good" industries. :-)

Purchasing agents must be making bundles of money now!

Just think what you could do with a little hard work and study
to get an engineering diploma...you could be making bundles
upon bundles of money and specifying what purchasing buys
instead of placing orders. Of course, that wouldn't be
amateur work anymore. Engineers get "tested" every day in
design and the only certificate/diploma they get for that is a
continuing paycheck. Not a callsign you can use for bragging
rights but you can, literally, take it to the bank. :-)

> Nope...just you. You deserve it, since YOU have been trolling

I've never met actress-comedienne Ruth Buzzy. What has that to
do with a humorous reposting of old material by Hans Brakob
on what an engineer is?

It must be that overconcern with code skills and keeping standards
and practices of the USAMCC dulls the sense of humor. :-)

The electronics industry in general simply replaces board assemblies because it is cheaper to do so in the long run.

Faulty boards are often processed to recover gold and other precious metals. There exist several companies that make a profit on doing so...addresses in many industry Buyer's Guides.

>I own an old Ten Tec OMNI D, built in the early 80s. Do you think most hams

Heh heh heh...I don't have a singular crystal ball, Steebie.

Interesting reaction due to Fury and Rage! :-)

> Lenni, almost every post you make is intended to insult or troll.
>The first post of this thread is pure proof of that. It had absolutely
>NOTHING to do with the implementation of ANY policy. Just your
>attempts to further incite discontent.

No doubt the Service Members of the United States Amateur
Marine Code Corps think so.

Policy: What the FCC instituted in 1990 (Technician class
amateur license, no code test) has proved to be quite popular
and continues to be the fastest-growing license class. That's
according to public data from the FCC. In only a decade it is
responsible for attracting roughly a quarter million licensees.

It's obvious that some do not wish to hear of that, especially the
stalwart, superior Dill Sergeants of the USAMCC. :-)

> Hmmmm....call me "Steebie" (pablum caught in your dentures again?)
>and THEN attempt to cahstise ME for "insult(s), belittlement,
>denigration, etc, etc"...?!?!?

Oh, my, I was guilty of thinking that replies in kind were okay,
especially after having been addressed as such for over a year.

Is everyone to call you "Sir" because of your rank, status, and
general superiority in the USAMCC?

>> All I did was post a comparison between the code-tested licensees
>> and the non-code-tested licensees in the US ARS.
>
> No what you did was troll. You succeeded.

All I did was post a comparison between the code-tested licensees
and non-code-tested licensees in the US ARS. Another Extra
class argued on the numbers presented and we have had a debate
and argument over what should have been presented. You have
neither argued nor debated those numbers or what should have
been presented.

> You ATTEMPT to ask one of those "Do you LIKE having sex with your
>sister" questions.

I've never asked you about having sex with your sister. I don't
know if you have a sister. :-)

> Of course they are "real hams". The "arguement" is
>NOT are they real hams, but are YOUR numbers valid. THAT answer is NO.

"NO" based on what? Public data from the FCC? Are you calling
the FCC Liars?!?

>> See, there you go again, being uncivil, rude, insulting...sort of an
>> extra grade asshole.
>
> And now the resulting profanity.

Heh heh heh...ex-marines complaining of profanity! :-) :-) :-)

> And WE (yes, WE) DON'T CARE! NONE of that makes a didly squat
>difference because THIS NG is about HAM radio...NOT "Ex Engineers With
>A Chip On Thier Shoulders".

Now, now, calm down. You said I was a "technician" in industry
and I replied that I was an engineer. I was and still am.

I've not had a Chip on my shoulders but I once got a pair of
cuff links for my father made from old thin-film hybrid circuits.
Unique...only jewelry that came with a schematic!

This newsgroup is, similarly, not about nursing, health care, or
industrial purchasing agents (who use company computers on
company time to Internet). :-)

> Probably for the same reason YOU keep lying, using profanity and
>generally being an annoying little twerp. Because I CAN.

You civility and genteel nature has not been noted here for a long
time. :-)

>> PS: Good going, Steebie, you got in early to work to post e-mail

> No you don't. You do your damned best to create a few.

Nope. Just pointing out Urban Myths, falsehoods, folk sayings,

Are you saying the FCC is NOT the only US agency that licenses
US radio amateurs?

Are you saying that FCC databases are NOT public?

>> You've done nothing of the kind, only shot off your keyboard again.
>

I'm sure you have extra-wide margins on everything. :-)

> Which in only ONE month exceeds your total for the DECADE.

Amazing! Well, don't just stand there, go out and hump up someone
to nominate you for the Nobel Prize. [they DO have a ham radio
category, don't they? if not, I'm sure you will want to go whip them
into shape, put them through close-order drill, make MEN out of
the Committee. :-)]

> Adios, Chump. Get a life.

Thank you, I have one. No worries about second jobs, money,
living away from home, or damaged ego in newsgroups.

Now, let's return to the original thread start. Newcomers to US
amateur radio are mostly NOT choosing to go through the hoops
of seeking a code-tested amateur license. Why is that?

For damn certain, they aren't choosing to join some United States
Amateur Marine Code Corps, to march in ranks under the
militant "leadership" of abusive Dill Sergeants who religiously
follow the Proper Code (of conduct).

You and the obersturmbandsfuhrer keep saying that No One Can
Possibly Know Anything About Amateur Radio Until They
Become Properly Licensed. If that is so, why should there be
any interest in becoming a US radio amateur through a test?

Seems to me that such an attitude turns people away...unless
they like living under self-professed, self-appointed non-comms
with a superior control-freak compulsion.

It is doubtful that many will want to Follow Orders from those
Who Know Better Than Everyone Else. You and the obersturm-
bandsfuhrer act that way. It is Your Way or Die. No quarter.

US amateur radio must be a real tough military Service
according to you! :-)

3105. Industry Canada Proposal to Lower Code Speed to 5 wpm;

Newsgroup: rec.radio.amateur.policy
Date: 2001-02-10 20:19:51 UTC
From: "M. Soft" <abuse@home.net>
Message-ID: <Hnhh6.66551$t94.882370@news1.rdc1.bc.home.com>
Source record: 3455
Cross-posted to: alt.ham-radio.nocode,can.general,rec.radio.amateur.policy

I am posting this message for discussion.....

FROM : Carl R. Stevenson - WA6VSE
Executive Director, No Code International

TO:

SUBJECT: Industry Canada Proposal to Lower Code Speed to 5 wpm;
NCI Needs to Establish a National Chapter in Canada to Support
Adoption of this Proposal - YOUR Help is Needed!

DATE: Saturday, February 10, 2001

Dear ?,

As you may be aware, Industry Canada recently issued a proposal aimed at lowering the Morse code test speed for "full privilege" licenses in Canada to 5 wpm. Complete information on this proposal may be obtained by following the link in the following article copied from the NCI website.
Canada Issues Public Notice Proposing Rules Change to Replace 12 wpm Morse test with 5 wpm test!!!
For more information, click on the following link to a copy of the Notice with some live links to an e-mail address where comments may be sent and to an Industry Canada website where comments may reportedly be viewed.
At a bare minimum, we need all of our Canadian members to file comments with Industry Canada in support of this proposal. Comments are due 60 days from the Publication Date, which was 2001-01-06.

However, the Board of Directors of NCI also feels that it is very important that we establish a National Chapter of NCI in Canada to represent our Canadian members' interests. In order to establish a National Chapter of NCI in Canada, we need a National Chapter Chairperson.

Therefore, we are seeking suitably qualified volunteers for the position, who are presentable, articulate, able to deal with regulators and those with opposing views in a diplomatic fashion, and passionate about NCI's goal of ultimately eliminating ALL Morse proficiency testing as a prerequisite for all classes of amateur license. Familiarity with Canadian regulatory practices and officials, good writing skills, and either being located near or having the ability to travel occasionally to Industry Canada's main offices to lobby for the cause, would be also be highly desirable attributes.

Please take a few moments to review the material (including the Bylaws provisions relating to National Chapters) at:
http://www.nocode.org/National_Chapt_Notice.html If you are interested in

being considered as a candidate for NCI's Canadian National Chapter Chairperson, please e-mail a brief letter stating your interest, why you think you would be a good representative for NCI in Canada, and a brief "resume" of your amateur radio background and interests to me at: wa6vse@fast.net for consideration by the Board of Directors.

We NEED to fill this position . please don't assume "Someone else will do it." . if you're interested and feel you could contribute in this role, PLEASE take the initiative and indicate your willingness to help!

73,
Carl R. Stevenson - WA6VSE
Executive Director, No Code International

Well said.

By the way, who is "Ken"? and if freebanders are so mature, why are they ignoring the FCC, breaking the law, and putting all of our frequencies in jeopardy, ham, CB, and freebander? Doesn't sound all that mature to me.

I have had nothing but good experiences with HQ staff people,
starting with Dick Baldwin and going up to the present time,
both in my too-few visits to HQ and when I met them "in the
field".

They may not have always agreed with me (ask Steve Mansfield
about our heated differences on the Feingold Bill) but we never
failed to show mutual respect for each other.

Jon, now let's be fair to Larry. He does have some favorite people.
For instance, he once posted that his favorite Black on the bus was the
driver. Because he was the only one with a job.

Makes me wonder what they are actually doing during the 10-10 CW
contest. ;)

My comment was directed toward the single-mindedness of collecting
10x numbers, and the inability to ragchew by a few of the herd. Not
anything pro or con about modes.

>Service.

All true - but that's not the point.

When AM was the predominant voice mode on the HF/MF ham bands, an SWL could tune across almost any of the 'phone parts of those bands and find ham QSOs that were easy to tune in and easy to understand. Many hams of the that era tell of discovering ham radio by accidentally coming across hams using AM.

When SSB took over the prime spot, and AM became less common, the chances of that sort of thing happening decreased markedly. And to find the remaining AM hams, an SWL had to crawl through lots of SSB signals. End result: What was once a good source of new hams was greatly reduced.
>

>$29.95 Heathkit AR-3)
>> which made SSB copy possible.

The AR-3 had a "reflex" BFO - the first audio stage was made to oscillate. The results were far from optimum.

I had the predecessor AR-2 receiver, which had a separate BFO. It was not a very good SSB receiver.

A WW2 surplus "Command set" receiver was much better. But SWLs rarely used those.

> I think that any SWL worth his salt could still listen to hams...

Sure - but there were not as many that were EASY to listen to. That's the point. It must be remembered that the unskilled SWL probably didn't know to turn on the BFO, turn down the RF gain, turn up the AF gain and tune very slowly. And most of the inexpensive receivers of that time would win the Zelda Fitzgerald award for stability.
>

Those things are prized items today. 1L6s are even more prized.

>
I never touched the dern things. Went straight to ham radio.

>> >TV watching increased all through the '50s and '60s.
>
>> How does that explain the sudden stop in '62?

All of those factors were slowly increasing their effects on ham radio growth.
>
>And TV watching increased through the 70s and 80s, too, a time of steady
>growth in amateur radio.

But the novelty was gone. When TV was new, it was a big deal, but the viewing
was limited by the limited number of stations and the limited time they were on
the air. TV was expensive and many areas did not have good TV coverage. By the
early '60s, the prices had dropped, stations were everywhere and "almost 24/7"
telecasting was starting to show up. (I remember when seeing a "test pattern"
on TV was common, and listening to the national anthem as the station signed
off after the 11 pm news. That's all gone).

Point is that a new thing like TV eats up people's spare time, money and
interest for awhile. Then, as it becomes commonplace, it fades into the fabric
of life.

PCs and the Internet are doing the same thing. Eventually home computers and internet connections will be as common as TV, if not more so.

>Tentec also sells both an HF and a VHF transceiver that work this way.

I don't know about the VHF models, but the HF/MF ones are the Pegasus and Jupiter. They are actually the same basic unit - the Jupiter has a "front panel" with controls and the Pegasus needs a PC to control it. (The Pegasus has been called the "poor man's Kachina" by some).

But the receiver dynamic range (blocking and IMD) on them are not very good. The old Ten Tec Corsair 2, designed in the mid '80s, has much better performance in that area. The Elecraft K2 blows it away on those specs.

It's a matter of bells and whistles vs. genuine receiver performance. DSP filtering at the tail end of a receiver isn't going to fix overloading and intermod ahead of it. This is not new stuff - By Goodman wrote about it in 1957 ("What's Wrong With Our Present Receivers?")

That basically says it all. DDS spurs will also cause all sorts of receiver spurious responses, too.

Then why have YOU been posting my license numbers, Lennie? I sure
didn't.

Again, "rules" only apply to others...NOT to Lennie.

It's Chattanooga. No, I am afraid that Chattanooga doesn't yet
have the concentration of electronics inductry that Atlanta does. I am
sure, however, when many of them tire of the bumper-to-bumper traffic
and being afraid to go anywhere without armed escort, Chattanooga will
catch the overflow.

> Purchasing agents must be making bundles of money now!

I wouldn't call it bundles, but ANTEC's stock falterings are not a
complete view of it's performance.

Again, like your "views" of Ham Radio, you look from the outside
in and make poorly substantiated judgements on that. Oh well. Nothing
we haven't become accustomed to.

>Not a callsign you can use for bragging rights but you can,
>literally, take it to the bank.

I already DO have "bragging rights", Lennie. In more than one
field of endeavour.

G'night, Lennie. Mrs A has your dose of Geritol ready.
